Abstrak

Penelitian ini bertujuan untuk mengetahui kontrasepsi DMPA terhadap penurunan hCG pada penderita pasca evakuasi mola hidatidosa. Selain itu juga untuk mencari kontrasepsi yang ideal bagi penderita pasca mola hidatidosa. Penelitian dilakukan di bagian Obstetri dan Ginekologi FKUI/RSCM sejak tanggal 1 Desember 1985 sampai dengan tanggal 31 Oktober 1986, dan didapat 42 penderita mola hidatidosa, di mana 2 penderita dikeluarkan dari penelitian. Dari 40 penderita yang masuk dalam penelitian, kemudian dibagi menjadi dua kelompok secara random masing-masing 20 penderita mendapat DMPA dan 20 penderita lainnya mendapat kondom.

.....This study aims to determine the contraception of DMPA against the reduction of hCG in post-evacuation patients of mola hidatidosa. In addition, it is also to find the ideal contraception for post-mola hidatidosa sufferers. The research was conducted in the Obstetrics and Gynecology section FKUI/RSCM from December 1, 1985 to October 31, 1986, and 42 patients with mola hidatidosa were obtained, of which 2 patients were excluded from the study. Of the 40 patients who were included in the study, they were then randomly divided into two groups, each 20 patients received DMPA and 20 other patients received condoms.
