ABSTRACT

Special needs patients (SNP) have difficulty accessing dental services, partly due to reluctance of dentists to treat them. **Objective:** We assess didactic and clinical training experiences of final-year dental students and new graduates in managing SNP. **Methods:** An online questionnaire was sent to 123 final year dental students and new graduates, assessing their experiences and readiness in handling SNP. **Results:** Majority of the respondents were not confident in attending to SNP. Majority gained knowledge in handling SNP via lectures while more than half had managed patients with complex medical history. Majority mentioned a lack of clinical training to treat SNP as their dental training experience had only been in a dental school clinical setting. Most of the respondents hope their curriculum would include more education to improve clinical skills in managing SNP. **Conclusion:** Respondents demonstrated minimum training and lack of confidence and skills that might contribute to a lack of preparedness to manage the oral health care needs of SNP. Clinical exposure in managing SNP at the undergraduate level is still inadequate and it needs to be emphasized in the curriculum.

Keywords: SNP, special care dentistry, undergraduate curriculum, dental care

INTRODUCTION

Patients requiring special dental care in Malaysia, as in other parts of the world, have recently become more significant. The United Nations estimated a total of 2.8 million people in Malaysia with disabilities.¹ In 2010, World Health Organization (WHO) approximated about 15% of the world's population lives with disabilities with at least 2% to 4% living with significant functional disabilities.² The increase in the population of special needs patients (SNP) is probably due to the increase in their life expectancy.³ According to WHO data, which was published in 2011, life expectancy in Malaysia is approximately 72 years for males and 76 years for females.⁴ Disabilities not only affect the individuals but also on the people around them such as families and care takers, support systems as well as the delivery of health care services.³

People with disabilities as those who have long-term physical, mental, intellectual or sensory impairments, which in interaction with various barriers may hinder their full and effective participation in the society.⁵

In terms of oral health, Commission on Dental Accreditation (CODA) defines special needs patients as individuals 'whose medical, physical, psychological or social situations make it necessary to modify normal dental routines in order to provide dental treatment for that individual. WHO International Classification of Functioning (ICF) model has defined people requiring special dental care as those with disability or active restriction that directly or indirectly affects their oral health.⁶ Special care dentistry (SCD) is defined as the branch of dentistry that provides dental services to patients with physical, medical, developmental or cognitive conditions which limit their ability to receive routine dental care.⁷ People with disabilities have poorer oral health and poorer general health outcomes due to high levels of unmet needs as well as fear and inability to access oral health care services.⁸⁻¹⁰

In order to ensure SNP receive appropriate and adequate oral health care services and to reduce inequalities in oral health, it is very crucial that current dental

Table 1: Types of classroom-based methods used to teach SCD

Methods	Yr5	FYDO
Lectures	62 (98.4%)	40 (97.6%)
Problem Based Learning (PBL)	48 (76.2%)	22 (53.7%)
Small group discussions	35 (55.6%)	16 (39.0%)
Videotapes/DVD	2 (3.2%)	3 (7.3%)
Demonstrations	36 (57.1%)	6 (14.6%)
Case studies	45 (71.4%)	10 (32.3%)

practitioners and their dental nurses are well equipped to provide dental treatment to SNP. It is also important to educate future oral health care providers to treat SNP by exposing them to SCD at the undergraduate level. CODA stated that ‘graduates must be competent in assessing the treatment needs of SNP.’¹¹ In studies conducted by Waldman and Perlman, they found that most dentists reported a lack of knowledge in providing care to SNP.¹² It was found that less than 50% of participating dental school in a survey in the USA required their students to have clinical experience treating SNP.¹³ Due to the reasons mentioned above, majority of the practicing dentists do not have the confidence and willingness to treat special needs patients. The significance of SCD in dental schools in Malaysia is still unclear although the specialty has recently gained its recognition with the inception of three centers providing SCD services.

It is very crucial to provide education on SCD in dental schools at undergraduate level. Therefore, the objectives of this study are to assess the need to include SCD curriculum in the undergraduate level and to provide feedbacks that would help in gauging the interest of SCD among the students.

METHODS

The study was approved by the Faculty of Dentistry University of Malaya Medical Ethics Committee. A draft of the questionnaire form was designed by the investigators based on a previously administered survey.¹⁴ The questionnaire was prepared as an E-survey on the Kwik Survey platform. Before being distributed, the questionnaire was sent to all the authors to test its effectiveness. Between January and February 2015, an e-mail with a link to the survey was sent to 123 participants consisting of final year dental students (Yr5) and First Year Dental Officers (FYDO) who just graduated from University of Malaya.

Participants were requested to reply within a month and given constant reminders via Facebook and Whatsapp

messages. The survey basically consisted of classroom based dental education concerning treatments of SNP, clinical education concerning the treatment of SNP, and questions concerning the future professional life with regards to providing care to SNP following the model used by Krause et al.¹⁵ All responses were anonymous and only people responsible for the data collection had access to the information participants provided. Data were gathered and recorded in Microsoft Excel while analysis was done using SPSS (version 17).¹⁶

RESULTS

A total of 104 responses were received (84.6% response rate) comprising of 63 Yr5 students and 41 FYDO. Majority of respondents in both groups were more likely to be female. Almost all respondents claimed to have been exposed to lectures in SCD while more Yr5 students have been exposed to other methods of teaching-learning like PBL, small group discussions, demonstrations and case studies (Table 1).

In terms of clinical settings that helped in gaining experience in managing SNP (Table 2), 87.3% of the Yr5 students and 73.2% of the FYDO respectively claimed that the experience was mainly gained from dental school clinical setting followed by the day care centers for the disabled. Some also claimed that experience was gained from hospital-based dental clinic, community rehabilitation center as well as old folks’ homes. Due to their additional experience, FYDOs seem to have managed more SNP during their clinical postings. This is shown in Table 3. More than half of both groups of respondents have experienced managing patients with complex medical history. In addition, majority of FYDOs have experience managing patients with intellectual disability (65.9%).

Table 4 provides an overview on the perception of the respondents towards the teaching of SCD at the dental school. Majority of the respondents agree the subject should be included in the curriculum and believe the school is moving in the right direction of equipping

Table 3: Types of SNP having been managed during clinical posting

Types of patients	Yr5	FYDO
Physical disabilities	11 (17.4%)	15 (36.6%)
Sensory impairments	12 (19.0%)	13 (31.7%)
Intellectual disabilities	13 (20.6%)	27 (65.9%)
Complex medical history	33 (52.4%)	28 (68.3%)
Home-bound elderly patients	10 (15.9%)	7 (17.1%)
Communicable infections	10 (15.9%)	23 (56.1%)
Socially deprived	2 (3.2%)	7 (17.1%)
Drug or alcohol abuse problems	0 (0%)	5 (12.2%)
Adult onset neurological diseases	7 (11.1%)	6 (14.6%)
Psychopathologies	13 (20.6%)	15 (36.6%)

Table 4: Perception towards teaching of SCD at dental school

	Yr5	FYDO
My classes prepared me well for managing SNP	24 (38.1%)	11 (26.8%)
The curriculum should include more education about managing SNP	49 (77.8%)	40 (97.6%)
I believe that my dental school has an honest interest in treating SNP	56 (88.9%)	31 (75.6%)
The dental education I received for managing SNP is adequate/sufficient	27 (42.9%)	12 (29.3%)
My clinical skills were adequate for me to be able to treat SNP	8 (12.7%)	14 (34.1%)

Yr5=final year dental student; FYDO=first year dental officer

them with the necessary knowledge. Although less than half the respondents feel that the dental education they received prepared them well to manage SNP, Yr5 students seem to agree more than the FYDOs. However, compared to the FYDOs, majority of Yr5 students feel their clinical skill gained thus far is very inadequate to treat SNP.

The final objective of the study was to assess the respondents' willingness to provide care in the future (Table 5). Regardless of the lack of awareness and knowledge on SCD, respondents showed great interest to manage SNP in the future. Despite the inadequacy of their clinical experience in treating SNP, a large number of respondents, 49.2% of Yr5 students and 53.7% of FYDOs believed that they would be able to provide care for their special needs patients. They are aware that providing care for SNP will take more of their time, make themselves as well as the patients more anxious and may not be cost-effective for their practice. However, they are ready to spend extra money to make their practice SNP friendly because it will help them feel a sense of satisfaction to have been able to treat the patient

Table 5: Respondents' willingness to provide dental treatment to SNP in the future

	Yr5	FYDO
Providing care would not take too long	16 (25.4%)	7 (17.1%)
The care would not make patient anxious	13 (20.6%)	9 (22.0%)
I can provide quality care for my patients	31 (49.2%)	22 (53.7%)
I am not concerned that my practice would end up with too many special needs patients	18 (28.6%)	17 (41.5%)
It would not disrupt the organization of my practice	30 (47.6%)	22 (53.7%)
I would know how to deal with the patient's behaviour	40 (63.5%)	21 (51.2%)
I will be able to communicate effectively	36 (57.1%)	23 (56.1%)
It would not make me anxious	17 (27.0%)	9 (22.0%)
It would be safe for me and my team	29 (46.0%)	22 (53.7%)
The treatment will be cost-effective for my practice	20 (31.7%)	16 (39.0%)
The patient will follow my after-care instructions	7 (11.1%)	13 (31.7%)
I would rather refer the patient to a specialist	26 (41.3%)	18 (43.9%)
I feel a sense of satisfaction to be able to treat the patient	52 (82.5%)	32 (78.0%)
I will spend extra money to make my practice SNP friendly	32 (50.8%)	26 (63.4%)

Yr5=final year dental student; FYDO=first year dental officer

DISCUSSION

This web-based or electronic survey is cost effective and it is easy to track the non-responders compared to paper-based surveys. Apart from that, E-surveys are definitely more environment friendly, have less data entry errors and provides quicker access to the response. The response rate is also very encouraging. This is also supported by a study that found the majority of online responders responded after the first invitation and young respondents preferred web-based surveys.¹⁷ However, one need to make sure the email addresses of the respondents are current and because there is no monetary incentives for the respondents, the survey administrator will need to repeatedly invite those who fail to participate.¹⁸

Based on the outcome of this study, it is very clear that including SCD at the undergraduate dental curriculum is very important and it is crucial that a dental school graduate knows how to diagnose and assess the treatment needs of SNP. Many patients who currently fall under the remit of special care dentistry could be treated safely in general dental practice.¹⁹ The

traditional curriculum exposes students to managing patients with complex medical history, especially those seeking dental extraction. However, with the introduction of SCD, the students can be exposed to managing a larger cohort of patients that include those with physical disabilities, home-bound elderly, patients with communicable infections, socially deprived patients, patients with drug or alcohol abuse problems, patients with adult onset neurological diseases as well as patients with psychopathologies, provided the dental school has a dedicated, free-standing special needs clinic.

Studies reported that majority of dentists and dental students still lack clinical experience in treating SNP.²⁰ A varied, multi dimensional educational experience in SCD at undergraduate level plays an important role in developing students' positive attitude, confidence and willingness to treat SNP later in their practice¹⁴. These findings are consistent with the findings in our study where many respondents demonstrated reluctance and lack of confidence in treating SNP. Our study also demonstrated that majority of the respondents have never managed certain patient groups like those with communicable infections, sensory impairment, drug or alcohol abuse problems as well as those who are socially deprived. These are SNP who can be treated by any general dental practitioner but due to poor exposure, they tend to develop a stigma towards these patients and avoid treating them.

Based on the results from our study, majority of the respondents will not refuse providing treatment to SNP. However, there seems to be a great variation in the attitude and willingness towards managing SNP among the respondents even though they come from the same dental school. It would be interesting to investigate further the factors determining respondents' attitude towards SNP. This study has also proven that majority of the respondents lack confidence in providing treatment to SNP, leading to a reduction in the number of SNP receiving treatment and inequality in oral health care. In order to make sure SNP receive the treatment they ought to receive, it is very important that SCD is taught and emphasized at the undergraduate level. Similar studies^{3,21} have shown that students who received exposure in treating SNP had positive experience and the exposure they received influenced their willingness to provide dental treatment to SNP.

SCD has been covered as an integrated module in the undergraduate curriculum for the last 2 academic years at University of Malaya. Students are exposed to examining, diagnosing and preparing treatment plan for the SNP. Since the last academic year, we run a dedicated SCD clinic under two specialists which the Yr5 students attend on a rotation basis. In addition, Yr4 students conduct a field visit to any one center for special needs like home for the aged or disabled,

rehabilitation centers for physically and intellectually disabled or socially deprived. Since this academic year, Yr3 students undergo a Disability Equality Training (DET) workshop conducted by officials from the Ministry of Women, Family and Community Development. We intend to deliver the SCD curriculum using as many methods as possible because it has been reported that interactive multimedia, virtual patient learning modules with the help of case studies were very effective teaching methods.²² FYDO have better and more varied experience with SNP because during their government attachment they are posted to the public hospital where they obtain much hands-on experience. This should be emulated at the undergraduate level as well.

Research has shown that most dentists do not want to treat SNP because they find it stressful and challenging.²³ Dao et al. rightly stated that 'the better the dentists had been educated about providing care for SNP, the better their attitudes were and the more likely they were to provide services for these patients'.²⁴ Not all patients with disabilities require special care and general dental practitioners can treat majority of the patients with mild to moderate disabilities.

At present, there is no standardized method to compare dental schools in Malaysia with regard to the standards of competence required for SCD program. The Malaysian Qualifications Agency, which is a statutory body set up to accredit academic programs provided by educational institutions, need to look into new accreditation standards for SCD programs at undergraduate level. Future research should also focus on developing best practices for dental schools to eliminate oral health disparities and access to care issues for these patients.

CONCLUSION

Both group of respondents demonstrated minimum training and lack of confidence and skills that might contribute to a lack of preparedness in general dental practice to manage the oral health care needs of SNP. Clinical exposure in managing SNP at the undergraduate level is still inadequate and it needs to be emphasized in the curriculum. The higher education accreditation body needs to initiate development of standards of competence in managing SNP for undergraduate dental students.
