Banyaknya parameter yang diestimasi menentukan besar kecilnya derajat bebas (*degree of freedom, df*). Besarnya derajat kebebasan dihitung dengan rumus:

$$df = \frac{1}{2} (p+q)(p+q+1) - t \text{ (joreskog dan sorbom, 1996:28)}$$

Dimana  $(p + q)$  adalah jumlah variabel manifest (*observed variables*) yang dianalisis dan  $t$  adalah jumlah keseluruhan parameter yang diestimasi. Jadi, besarnya derajat kebebasan untuk model ini adalah:

$$df = \frac{1}{2} (22)(22+1) - 68 = 208 \text{ (lihat } goodness of statistic \text{)}$$
