KATA PENGANTAR

Bismillahirrahmanirrahim

Puji syukur penulis panjatakan atas kehadirat Allah SWT yang telah melimpahkan taufiq, hidayah dan rahmat-Nya sehingga penulis dapat menyelesaikan tugas akhir ini.

Tugas akhir ini berisi tentang Studi Identifikasi Hemagglutinin Virus Influenza A Penyebab Pandemik Berkaitan dengan Spesifitasnya Terhadap Reseptor Sialic Acid Secara *In Silico*. Tugas akhir ini diajukan sebagai salah satu syarat untuk memperoleh gelar Sarjana Sains Program Studi Kimia Fakultas Matematika dan Ilmu Pengetahuan Alam Universitas Indonesia.

Penulis tidak lupa ingin mengucapkan rasa terima kasih kepada semua pihak yang telah bersedia dan turut serta memberikan andil. Terima kasih atas sumbangan tenaga dan pemikirannya dengan penuh kerelaan dan keikhlasan serta bentuan kepada penulis berupa spiritual, moril, materiil sebelum, selama dan sesudah penyusunan skripsi ini, yaitu kepada:

1. Ibu dan Ayahku, untuk cinta dan kasih sayangnya dan juga semua nasihat yang selalu senantiasa kalian berikan kepadaku. Harapan kalian merupakan motivasi besar dan semangat dalam kehidupanku.
2. Prof. Dr Usman Sumo Friend Tambunan sebagai Penasihat Akademik dan dosen pembimbing penelitian atas pengarahan, bimbingan, kesabaran serta dorongan moril selama proses penyusunan skripsi ini.

3. Dr. Ridla Bakri sebagai ketua Departemen Kimia Fakultas Matematika dan Ilmu Pengetahuan Alam Universitas Indonesia.
4. Tresye Utari M.Si sebagai koordinator penelitian dan Prof. Dr. Sumi Hudiyono sebagai Ketua KBI Biokimia yang telah memberikan kesempatan dan bantuan dalam penelitian.
5. Seluruh staf pengajar Program Studi Kimia FMIPA UI yang telah memberikan bimbingn dan motivasi selama mengikuti perkuliahan.
6. Rekan-rekan satu kelompok penelitian Bioinformatika : Danang, Ronggo dan Samira. Terima kasih atas kerjasama, kebersamaan dalam suka dan duka, serta semangat untuk saling memberikan motivasi. Terima kasih kepada Fitri Amelia M.Si yang telah memberikan dasar-dasar Bioinformatika dengan baik.
7. Yayu R, alumni Farmasi UI, untuk kasih sayang, semangat, motivasi dan kebersamaanya dalam suka maupun duka serta yang selama ini dengan sabar selalu menemaniku.
8. Sahabatku Agung, Faruk, Syarif, Yusni, untuk kebersamaanya dan rasa percaya yang diberikan, terima kasih atas persahabatan selama 4 tahun ini dan semoga terus berlanjut selamanya.
9. Sahabar-sahabat Kimia UI angkatan 2005 atas persahabatn selama 4 tahun ini yang telah memberikan banyak kenangan yang begitu indah.
10. Semua pihak yang tidak bisa penulis sebutkan satu per satu, atas segala bantuan dan dukungannya dalam proses penyusunan skripsi ini hingga selesai.

Semoga Allah SWT memberikan balasan dan selalu diberikan berkah, rahmat dan hidayah-Nya. Amiin.

Penulis menyadari bahwa skripsi ini masih jauh dari kesempurnaan dan terdapat banyak kekurangan, namun demikian penulis berharap semoga skripsi ini dapat memberikan manfaat dalam dunia Biokimia khususnya Studi Bioinformatika.

Penulis

2009

ABSTRAK

Salah satu faktor yang berperan dalam infeksi virus influenza A adalah adanya kecocokan antara *Hemagglutinin* (HA) dari virus dengan reseptor permukaan sel dari host. Permukaan sel host mengandung gugus terminal *sialyl-galactosyl* [Sia(α2-3)Gal] atau [Sia(α2-6)Gal]. Virus Influenza A yang berasal dari unggas cenderung berikatan dengan Sia(α2-3)Gal sedangkan yang berasal dari isolat manusia cenderung berikatan dengan Sia(α2-6)Gal. Hasil Alignment subtipe H1N1 menunjukan bahwa diperlukan mutasi asam amino pada posisi 190 dan 225 menjadi Asam Aspartat pada Hemagglutinin untuk mengenali reseptor Sia(α2-6)Gal sedangkan pada subtipe H2N2 dan H3N2 memerlukan mutasi asam amino pada posisi 226 dan 228 menjadi Leusin dan Serin. Berdasarkan analisis mutasi terhadap HA subtipe H1N1, H2N2, dan H3N2 yang telah menjadi pandemik, dapat diperkirakan bahwa *Hemagglutinnin* subtipe H5N1 memerlukan mutasi pada posisi 190 dan 225 menjadi Asam Aspartat pada HA untuk mengenali reseptor Sia(α2-6)Gal. Kemungkinan lain adalah memerlukan mutasi asam amino pada posisi 226 dan 228 menjadi Leusin dan Serin. Metode simulasi *molecular docking* mampu membentuk kompleks antara *Hemagglutinin* dengan Reseptor Sia(α2-6)Gal dan Sia(α2-3)Gal. Berdasarkan hasil kompleks yang terbentuk, metode simulasi *molecular docking* berhasil mengidentifikasi spesifitas *Hemagglutinin* terhadap Sia(α2-3)Gal atau Sia(α2-6)Gal

Kata kunci : *Hemagglutinin*, Influenza A, Sia(α2-6)Gal, Sia(α2-3)Gal.

BAB I

PENDAHULUAN

1.1 Latar Belakang

Pada abad 20 telah terjadi tiga pandemik Influenza A di seluruh dunia. Periode tahun 1918-1919 terjadi pandemik pertama yang disebabkan oleh virus Influenza A subtipe H1N1. Pandemik ini mengakibatkan lima puluh juta orang meninggal dunia. Pandemik kedua terjadi pada tahun 1957-1958 yang diakibatkan oleh virus Influenza A subtipe H2N2 dan diperkirakan mengakibatkan satu juta korban jiwa. Pandemik ketiga terjadi pada tahun 1967-1968 yang diakibatkan oleh virus Influenza A subtipe H3N2 dengan jumlah kematian diperkirakan satu juta korban jiwa (Kamps, Hoffman, & Preiser, 2006).

Pada tahun 1997, virus Influenza A subtipe H5N1 pertama kali terdeteksi di Hongkong. Virus ini menyerang dan menewaskan 6 orang dari 18 orang yang terinfeksi . Virus influenza A subtipe H5N1 telah menyebar di kawasan benua Asia mulai dari Jepang di utara hingga Indonesia di selatan. Hingga saat ini penelitian membuktikan bahwa infeksi virus Influenza H5N1 ke manusia akibat kontak langsung dari unggas dan belum mampu menyebar antar manusia (Horimoto T, Kawaoka Y. 2001). Hingga 2 Juni 2009, tercatat 433 orang terinfeksi virus Influenza A subtipe H5N1 dan 262 diantaranya meninggal dunia

(www.who.int/entity/csr/disease/avian_influenza/cases_table_2009_06_02/en /index.html, diakses pada hari Rabu 3 Juni 2009 pukul 09.18 WIB).

Sekitar bulan April 2009, virus Influenza A subtipe H1N1 kembali merebak di Meksiko dan mulai menyebar ke seluruh dunia. Pada 26 Juni 2009 tercatat 59.814 orang telah terinfeksi dan 263 orang diantaranya telah meninggal dunia. Penyebaran yang sangat cepat membuat lembaga WHO menetapkan status virus Influenza A subtipe H1N1 sebagai pandemik global. Ini adalah pandemik Influenza pertama di abad ke-21 (www.who.int/csr/don/2009_06_26/en/index.html, diakses pada hari Senin 29 Juni 2009 pukul 10.30 WIB).

Strain Virus Influenza untuk menjadi pandemik harus memenuhi tiga syarat utama. Virus mempunyai kemampuan untuk menginfeksi, menyebabkan kematian, dan mampu bertransmisi antar manusia secara mudah. Kemampuan Hemagglutinin Virus Influenza untuk mengenali SA(α2,6)Gal akan mendukung kemampuan Virus untuk menginfeksi, dan menyebar antar manusia sehingga akan memenuhi dua syarat yang dibutuhkan strain Influenza untuk menjadi pandemik (Kamps, Hoffman, & Preiser, 2006).

Salah satu faktor yang berperan dalam infeksi virus Influenza adalah adanya kecocokan antara *Hemagglutinin* (HA) dari virus dengan reseptor pada permukaan sel dari *host*. Permukaan sel *host* mengandung gugus terminal *sialyl-galactosyl* [Sia(α2-3)Gal] atau [Sia(α2-6)Gal]. Virus Influenza A yang berasal dari unggas cenderung berikatan dengan Sia(α2-3)Gal

sedangkan yang berasal dari isolat manusia cenderung berikatan dengan Sia(α2-6)Gal. Sia(α2-3)Gal merupakan reseptor sel permukaan pada Unggas sedangkan Sia(α2-6)Gal merupakan reseptor sel permukaan pada manusia (Matrosovich, 2004).

Mutasi dapat terjadi pada protein *Hemagglutinin* dan memungkinkan *Hemagglutinin* mampu mengenali reseptor Sia(α2-6)Gal. Potensi virus inilah yang dikhawatirkan sehingga virus dapat membuat varian-varian baru dari strain *Hemagglutinin* yang mampu menular antar manusia (Russel CJ and Webster RG. 2005;Stevens J. *et. al*. 2006).

1.2 Kedudukan Terhadap Penelitian Sebelumnya

Studi secara *in silico* terhadap mutasi *Hemagglutinin* dan *Neuraminidase* virus Influenza A (H5N1) telah dilakukan oleh kelompok Studi Bioinformatika dari Departemen Kimia Universitas Indonesia. Hasil studi telah menunjukan bahwa sekuen *Hemagglutinin* dari *Strain* Virus H5N1 isolat Indonesia belum mengalami mutasi secara signifikan dan belum terbentuk strain yang mampu menular dari manusia ke manusia. Hasil analisis filogenetik menunjukan bahwa sekuen *Hemagglutinin* dan *Neuraminidase* untuk virus Influenza A(H5N1) lebih dekat kekerabatannya dengan virus Influenza A(H1N1) dibandingkan dengan subtipe H2N2 dan H3N2 (Tambunan *et al*., 2008;Ridlo N.,2008;Hikmawan O.,2007).

Studi mengenai mekanisme pengikatan *Hemagglutinin* subtipe H5N1 dengan Sia(α2-3)Gal dan Sia(α2-6)Gal berdasarkan metode *Molecular*

Docking, Molecular Mechanic, dan *Molecular Dynamic* telah dilakukan. Hasil studi ini menunjukan bahwa hemagglutinin dari H5N1 berinteraksi dengan Sia(α2-3)Gal membentuk 11 ikatan Hidrogen sedangkan dengan Sia(α2-6)Gal hanya membentuk 3 ikatan Hidrogen. Hasil penelitian ini mendukung spesifitas *Hemagglutinin* subtipe H5N1 terhadap Sia(α2-3)Gal (Minyong Li& Binghe Wang.2006).

1.3 Perumusan Masalah

Pemahaman lebih jelas berkaitan dengan spesifitas *Hemagglutinin* terhadap Sia(α2-3)Gal dan Sia(α2-6)Gal sangat diperlukan untuk mengantisipasi kemungkinan pandemik Influenza. Oleh karena itu, penelitian secara *in silico* lebih lanjut perlu dilakukan terhadap *Hemagglutinin* dari subtipe yang telah menjadi pandemik. Berdasarkan sekuen *Hemagglutinin* yang berasal dari subtipe H1N1, H2N2, dan H3N2 akan dibandingkan perbedaan penyusun *Receptor Binding Domain* pada *Hemagglutinin* antara *host* manusia dan *host* unggas. Analisis mutasi dari subtipe *Hemagglutinin* yang telah menjadi pandemik dapat digunakan untuk memprediksikan kemungkinan mutasi pada subtipe H5N1 yang mampu mengenali Sia(α2-6)Gal. Pada penelitian ini juga akan menguji keberhasilan metode simulasi *Molecular Docking* untuk mengidentifikasi spesifitas *Hemagglutinin* terhadap Sia(α2-3)Gal atau Sia(α2-6)Gal

1.4 Tujuan Penelitian

Penelitian ini diharapkan dapat mengidentifikasi beberapa asam amino yang sangat mempengaruhi spesifitas *Hemagglutinin* subtipe H1N1, H2N2, dan H3N2 yang telah menyebabkan pandemik terhadap Sia(α2-3)Gal atau Sia(α2-6)Gal. Hasil identifikasi mutasi asam amino pada subtipe yang telah menyebabkan pandemik akan menjadi modal penting untuk memprediksi mutasi yang diperlukan untuk mengubah *Receptor Binding Domain Hemagglutinin* subtipe H5N1dari hanya mengenali Sia(α2-3)Gal menjadi mampu mengenali Sia(α2-6)Gal. Penelitian ini juga diharapkan dapat mengetahui keberhasilan metode simulasi *Molecular Docking* untuk mengidentifikasi spesifitas *Hemagglutinin* terhadap Sia(α2-3)Gal atau Sia(α2-6)Gal.

BAB II

TINJAUAN PUSTAKA

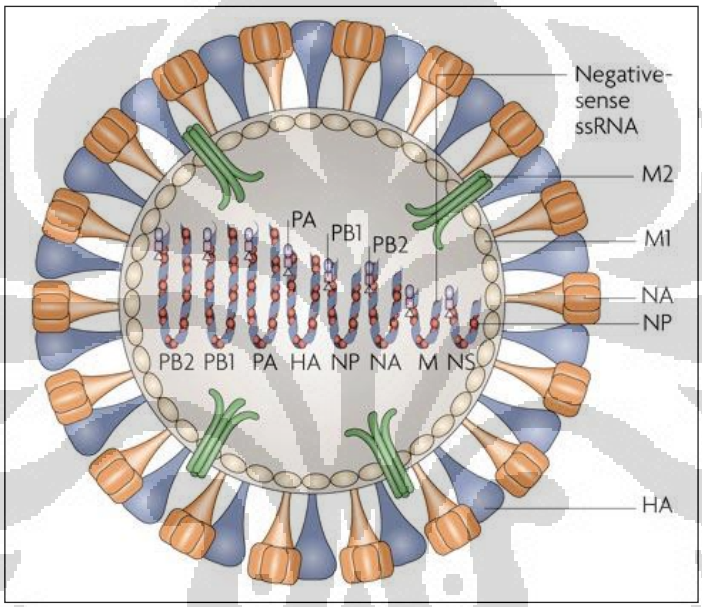
2.1 Definisi Virus Influenza

Virus Influenza merupakan virus yang termasuk dalam famili *Orthomyxoviridae* yang mempunyai selubung (*envelope*) dengan genom RNA berupa rangkaian tunggal berpolaritas negatif (*negative sense)* sebanyak 7-8 segmen. Pada manusia virus ini dapat menyebabkan demam, pusing, batuk dan dalam beberapa kasus serius, menyebabkan pneumonia pada anak-anak dan orang tua hingga menyebabkan kematian (Kamps, Hoffman, & Preiser, 2006).

2.2 Klasifikasi Virus Influenza

Perbedaan sifat antigen internal dari *nucleocapsid protein* (NP) dan *matriks* protein (MP) menjadi dasar dari pembagian Virus Influenza menjadi tipe A, tipe B, dan Tipe C. Virus Influenza A dan B terdiri dari delapan segmen RNA sedangkan virus Influenza C hanya terdiri dari tujuh segmen. Virus influenza A dapat menginfeksi unggas maupun mamalia (termasuk manusia) dan bersifat patogen terhadap hospesnya, sedangkan virus influenza B dan C dapat diisolasi dari mamalia (termasuk manusia) dan umumnya kurang patogen dibandingkan dengan virus influenza tipe A (Kamps, Hoffman, & Preiser, 2006)

Antigen Eksternal permukaan glikoprotein yang tersusun dari *Hemagglutinin* (HA) dan *Neuraminidase* (NA) menjadi dasar pengelompokkan lebih lanjut Influenza A menjadi beberapa subtipe. Virus Influenza A mempunyai 16 jenis Hemagglutinin dan 9 Neuraminidase. (Kamps, Hoffman, & Preiser, 2006)



Gambar 1. Struktur Influenza

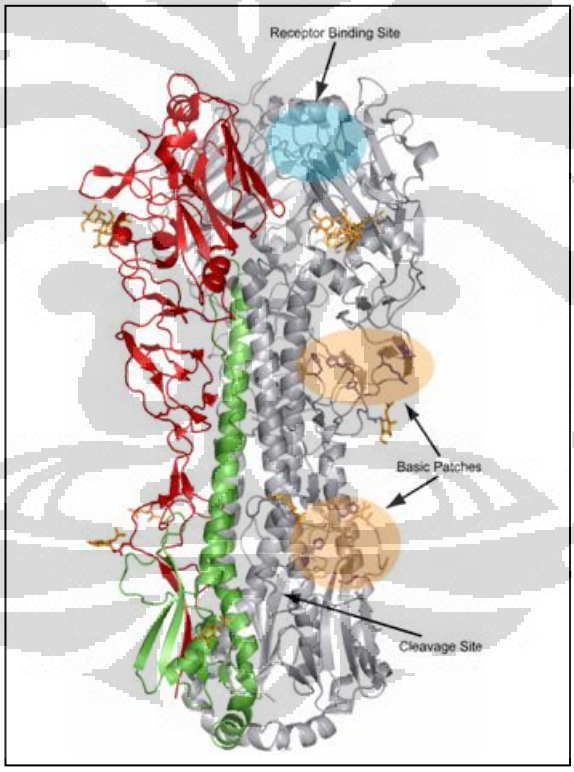
(Horimoto, T., et. al, 2005)

2.3 *Hemagglutinin* (HA)

Hemagglutinin merupakan *Homotrimer* glikoprotein yang memiliki dua atau tiga *glycosylation site* dengan berat molekul sekitar 76.000. *Hemaglutinin* ini mengelilingi membran lipid pada sisi luarnya dan setidaknya memiliki 5 daerah antigenik (*epitope*) yaitu A, B(membawa *receptor binding*

site), C, D, dan E. *Antigenic sites* berada dipuncak dari molekul HA sedangkan bagian bawahnya mengikat *lipid layer*. Bagian tengah HA memiliki *stalk region* dan *fusiogenic domain* yang dibutuhkan untuk *membran fusion* ketika virus menginfeksi sel baru (Kamps, Hoffman, & Preiser, 2006).

Hemagglutinin berfungsi sebagai reseptor dalam pengikatan virus terhadap sel host. *Hemagglutinin* akan berikatan dengan *sialic acid* (N-acetyl-neuraminic acid) dan menstimulasi penetrasi materi genetik virus dengan *membrane fusion.* (Kamps, Hoffman, & Preiser, 2006).



Gambar 2. Struktur *Hemagglutinin*

(Stevens J. *et. al*. 2006)

2.4 *Neuraminidase* (NA)

Neuraminidase merupakan glikoprotein seperti *Hemagglutinin* yang berada di permukaan virus membentuk struktur *tetramer* dengan rata-rata berat molekul 220.000 (Kamps, Hoffman, & Preiser, 2008). *Neuraminidase* berfungsi sebagai suatu enzim yang dapat menghidrolisis ikatan antara galaktosa dan *sialic acid* pada rantai ujung oligosakarid-glikoprotein. Fungsi lain dari *Neuraminidase* adalah untuk melepaskan partikel virus yang sudah selesai replikasi dalam sel *host* dan mencegah virus yang sudah terbentuk menempel kembali pada reseptor *sialic acid* melalui tonjolan Hemagglutinin. Oleh karena itu, efisiensi replikasi Avian Influenza sangat bergantung pada kerjasama protein *Hemagglutinin* dan *Neuraminidase* dari virus (Kamps, Hoffman, & Preiser, 2006; Suzuki *et al*. 2000).

Oseltamivir merupakan inhibitor yang mampu menghambat kerja Neuraminidase. Adanya inhibitor Oseltamivir akan menghambat pelepasan partikel virus yang selesai bereplikasi sehingga aktivitas infeksi virus akan berkurang (Kamps, Hoffman, & Preiser, 2006).

2.5 Protein Matriks (M)

Gen Matriks dari virus Influenza A menyandi dua macam protein yaitu protein Matriks 1 (M1) dan protein Matriks 2 (M2). Protein Matriks mempunyai peran dalam penyusunan *virion* virus Influenza. Bersama dengan

protein *Hemagglutinin* dan *Neuraminidase*, protein Matriks 2 menyusun struktur amplop virus dan berperan sebagai saluran ion. Protein Matriks 2 tidak hanya sebagai komponen struktural virus, tetapi juga berperan dalam proses awal infeksi dalam pemisahan protein M1 dari ribonucleoprotein (RNP) untuk masuk ke dalam sitoplasma sel *host*. Pemisahan ini dipicu pemindahan ion hidrogen melewati membran virus oleh protein Matriks 2 (Kamps, Hoffman, & Preiser, 2006).

2.6 *Polymerase basic* 1 (PB 1), *Polymerase basic* 2 (PB 2), dan *Polymerase acidic* (PA)

Ketiga jenis polimerase PB1, PB2 dan PA berperan dalam proses replikasi dan transkripsi. Gen *Polymerase Basic* (PB) menyandi *transkriptase* yang berperan diantaranya dalam *capbinding* dan *elongation*. Ketiganya memiliki aktivitas endonuklease dan terikat dengan ribonuleoprotein (Asmara, W. 2007; Kamps, Hoffman, & Preiser, 2006)

2.7 *Nonstructural protein* (NS)

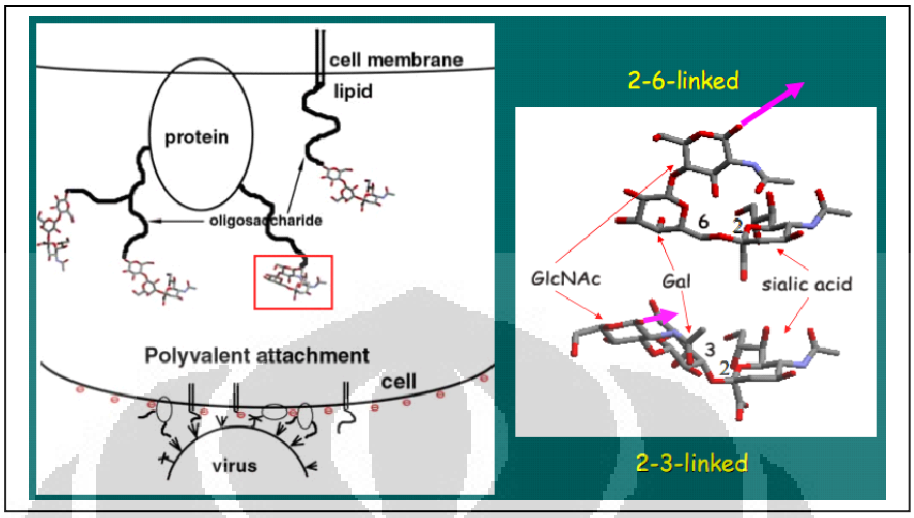
Gen Nonstructural menyandi 2 macam protein yaitu Nonstructural 1 (NS1) dan Nonstructural 2 (NS2). NS1 memiliki berat molekul sekitar 26.000 dan membentuk *dimer* yang dapat menginhibisi transfer mRNA sel *host* dari nukleus, sehingga memberikan kemudahan bagi viral RNA untuk bisa dibawa ke ribosom dan ditranslasikan. Selain itu NS1 juga dapat berperan dalam

resistensi terhadap respon interferon pada sistem imun sel host (Kamps,Hoffman&Preiser 2006)

NS2 merupakan molekul kecil dengan berat molekul 11.000. Protein ini kemungkinan terikat dengan M1 protein dan diyakini memiliki fungsi untuk memfasilitasi transport ribonuleoprotein yang baru terbentuk dari nukleus ke sitoplasma sehingga dapat mempercepat replikasi dari virus (Kamps, Hoffman, & Preiser, 2006).

2.8 Reseptor Sel Permukaan pada Saluran Pernapasan

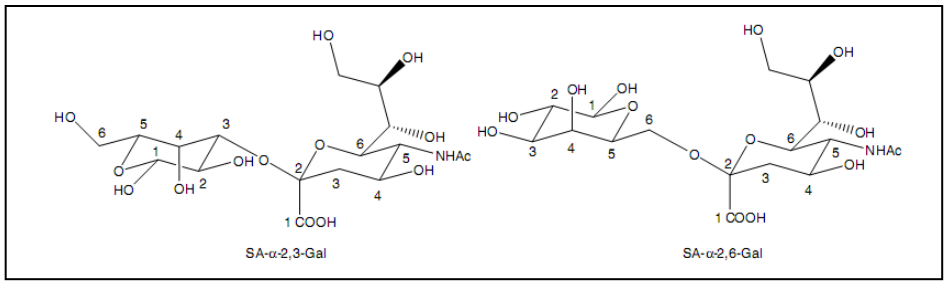
Salah satu faktor virus Influenza dapat menginfeksi manusia disebabkan karena adanya kecocokan antara *Hemagglutinin* virus dengan reseptor *sialic acid* pada permukaan sel dari *host*. Permukaan sel *host* mengandung gugus terminal *sialyl-galactosyl* Sia(α2-3)Gal atau Sia(α2-6)Gal. Virus Influenza A yang berasal dari unggas cenderung berikatan dengan Sia(α2-3)Gal sedangkan yang berasal dari isolat manusia cenderung berikatan dengan Sia(α2-6)Gal. Sia(α2-3)Gal merupakan reseptor sel permukaan pada Unggas sedangkan Sia(α2-6)Gal merupakan reseptor sel permukaan pada manusia (Matrosovich, 2004).



Gambar 3. Reseptor sel permukaan

(Matrosovich, 2004)

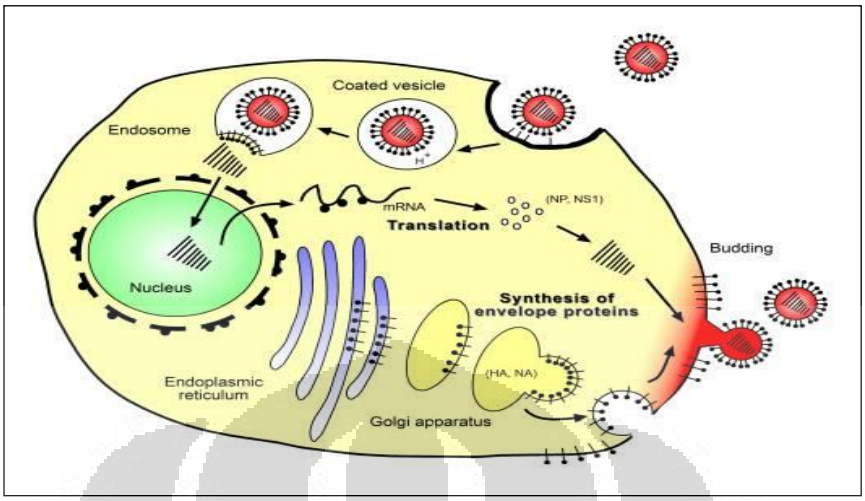
Penelitian akhir-akhir ini telah mengungkapkan bahwa pada manusia juga sedikit mempunyai reseptor sel permukaan Sia(α2-3)Gal pada saluran pernapasan bagian bawah. Penemuan ini menjelaskan kemampuan Hemagglutinin yang mampu bereplikasi pada manusia meskipun Hemagglutinin tersebut mempunyai spesifitas terhadap Sia(α2-3)Gal. Penemuan yang lain mengungkapkan bahwa tidak semua unggas hanya memiliki reseptor sel permukaan Sia(α2-3)Gal tetapi juga mempunyai Sia(α2-6)Gal seperti pada ayam dan burung puyuh. Berbeda dengan ayam dan burung puyuh, bebek hanya memiliki reseptor sel permukaan Sia(α2-3)Gal (Matrosovich, 2004).



Gambar 4. Struktur Sia(α2-3)Gal dan Sia(α2-6)Gal (Minyong Li & Binghe Wang, 2006).

2.9 Infeksi Virus Influenza A

Tahap pertama proses infeksi virus adalah proses pengikatan *Hemagglutinin* dengan *sialic acid* dari sel permukaan host. Langkah selanjutnya, virus akan masuk melalui proses fusi antara amplop virus dengan membran *endosomal* sel *host*. Langkah ini dilakukan dengan proses *endositosis* melalui mediasi penurunan pH pada phagosom. Penurunan pH akan dihentikan oleh kerja protein M2 setelah komponen virus telah masuk ke dalam sel *host*. Selanjutnya akan terjadi serangkaian penataan ulang protein matrix-1 (M1) dan kompleks glikoprotein *homotrimerik Hemagglutinin* sehingga menghasilkan sebuah *domain* yang sangat lipofilik dan fusogenik dari setiap monomer *Hemagglutinin* yang masuk ke dalam membran *endolisomal*. Proses ini akan memerlukan bantuan protease sel *host* untuk mengaktivasi prekursor *Hemagglutinin* (HA0) menjadi fragmen 1 (HA1) dan fragmen 2 (HA2) yang akan memungkinkan virus melepaskan ribonukleoproteinnya (RNP) (Asmara, W. 2007; Kamps, Hoffman, & Preiser, 2006).



Gambar 5. Siklus Replikasi Virus Influenza A

(Cox & Kawaoka, 1997)

Langkah berikutnya adalah transport RNP ke nukleus, dimana kompleks polimerase terikat pada viral RNA. Pada tahap ini terjadi pemutusan viral RNA oleh aktivitas endonuklease dan secara simultan terjadilah proses *elongation*. Pembentukan dari viral RNA akan dibatasi oleh NP yang akan membentuk mRNA. Viral RNA (vRNA) dikopi dari (-) sense menjadi (+) cRNA dan mRNA. cRNA akan tetap berada inti yang berfungsi sebagai template pada produksi (-) sense vRNA baru, sedangkan mRNA akan berpindah ke sitoplasma untuk memproduksi protein (Kamps, Hoffman, & Preiser, 2006).

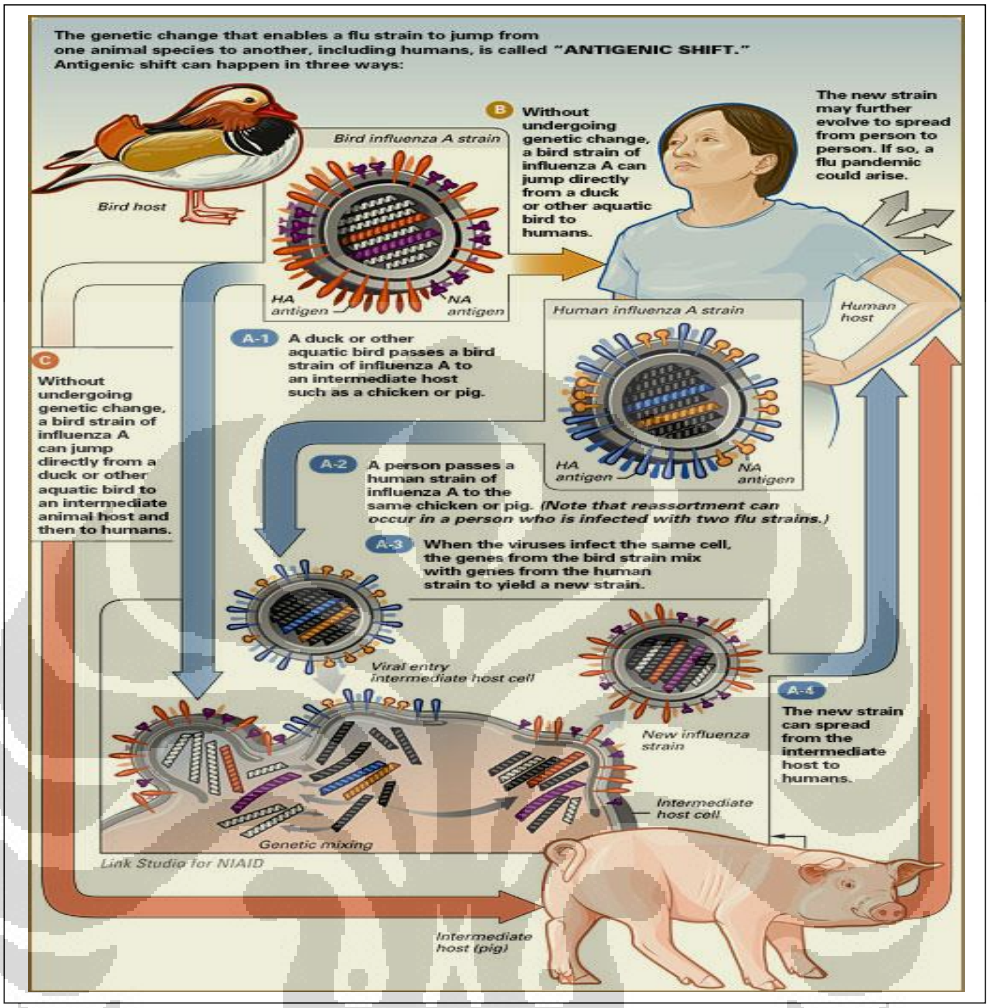
Langkah berikutnya viral protein yang baru terbentuk kembali lagi ke inti sel untuk membentuk vRNA lagi dan membentuk RNP atau viral protein yang baru terbentuk dikeluarkan menuju badan golgi dimana terjadi proses

glikosilasi. Protein yang dibentuk ini kemudian dibawa ke membran sel dimana mereka akan terikat dengan *lipid bilayer (Kamps, Hoffman, & Preiser, 2006).*

Tahap terakhir adalah vRNA dan inti viral meninggalkan inti sel menuju membran dan melakukan pemisahan dengan sel host melalui aktivitas NA, proses ini dikenal dengan sebutan *budding* (Kamps, Hoffman, & Preiser, 2006).

2.10 Antigenik Shift

Antigenik shift merupakan mutasi yang terjadi akibat *gene reassortment* (pertukaran atau pencampuran gen) yang terjadi pada dua atau lebih virus influenza tipe A sehingga terjadi penyusunan kembali suatu galur virus baru yang bermanifestasi sebagai genom virus Influenza yang baru. Antigenik shift terjadi oleh adanya perubahan struktur antigenik yang bersifat dominan pada genom virus Influenza. Sebagai contoh virus dengan Hemagglutinin subtipe H1 digantikan dengan subtipe H5 menghasilkan genom baru dari virus ini. Hal ini dapat terjadi ketika suatu sel *host* terinfeksi oleh 2 tipe virus Influenza yang berbeda secara bersamaan sehingga segmen gen dari kedua virus tersebut saling bertukar selama proses replikasi (Guan, Yi. 2007; Tumpey *et al*. 2002).



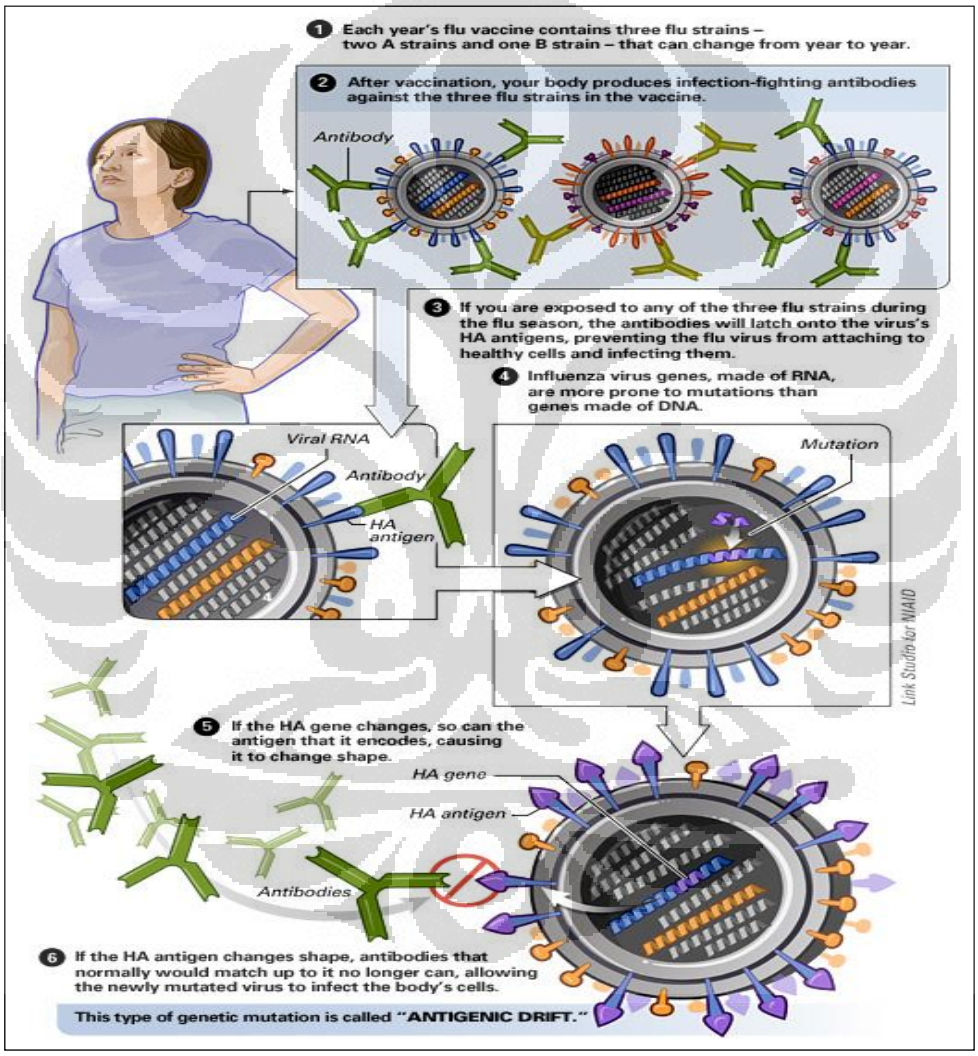
Gambar 6. Antigenik shift

(National Institute of Allergy and Infectious Disease)

2.11 Antigenik drift

Antigenik drift terjadi jika terdapat perubahan susunan asam amino ketika virus Influenza melakukan encoding terhadap genom virus setiap kali virus bereplikasi sehingga menghasilkan strain yang baru. Antigenik drift dapat terjadi oleh adanya perubahan struktur antigenik yang bersifat minor

pada genom dari virus Influenza. Antigenik drift berlangsung lambat, tetapi progresif dan cenderung menimbulkan penyakit yang terbatas pada suatu kawasan. Mutasi pada materi genetik dapat menimbulkan perubahan polipeptida virus, yaitu sekitar 2-3 kali substitusi asam amino per tahun (Asmara, W. 2007; Soepadi PZ. 2005).



Gambar 7. Antigenik drift

(National Institute of Allergy and Infectious Disease)

2.12 Struktur Protein

Protein tersusun oleh kombinasi asam amino melalui ikatan peptida membentuk struktur primer, sekunder, tersier, dan kuartener. Protein dapat merupakan satu rantai polipeptida maupun beberapa rantai polipeptida yang satu dengan lainnya membentuk ikatan atau interaksi tertentu. Perbedaan komposisi dan urutan asam amino penyusunnya mengakibatkan perbedaan sifat protein satu dengan lainnya (Baxevanis dan Oullete, 2001).

Struktur primer protein merupakan polipeptida yang menunjukan urutan asam amino penyusun serta ikatan disulfida (jika ada). Struktur sekunder menggambarkan struktur primer dan ikatan hidrogen antar residu asam amino yang berdekatan membentuk struktru α *heliks*, β *strands* dan *loop* Struktur tersier protein adalah nama lain dari struktur tiga dimensi suatu protein. Struktur ini terbentuk dari interaksi berbagai struktur sekunder yang berbeda dan membentuk folding dengan konformasi paling stabil sedangkan struktur kuartener merupakan interaksi antar struktur tersier (Baxevanis dan Oullete, 2001).

Struktur protein dapat diidentifikasi dari urutan asam aminonya, namun sifat biologis dari protein tidak muncul dari urutan asam amino yang linear. Melalui penentuan struktur tiga dimensi protein yang pertama kali pada tahun 1958, didapatkan suatu konsep dalam Biologi Molekular dan Bioinformatika, yaitu fungsi protein terkait erat dengan struktur tiga dimensi protein tersebut. Dua protein yang memiliki struktur tiga dimensi yang sama maka fungsi

kedua protein tersebut dapat dikatakan sama (Claverie & Notredame, 2003).

2.13 Definisi dan Ruang Lingkup Bioinformatika

Bioinformatika merupakan bidang ilmu yang menggunakan pendekatan komputasional untuk menyelesaikan persoalan biologis. Bioinformatika meliputi pengelolaan informasi biologis yang diperoleh dari berbagai penelitian yang menghasilkan data dalam jumlah banyak dan kompleks seperti pemetaan genom manusia. Bioinformatika mampu memberikan prediksi maupun simulasi dengan mempertimbangkan hubungan serta pola data biologis (Baxevanis dan Oullete, 2001).

Bioinformatika juga dapat diartikan sebagai teknologi pengumpulan, penyimpanan, analisis, interpretasi, penyebaran dan aplikasi dari data-data biologi molekul. Perangkat utama Bioinformatika adalah software yang didukung oleh kesediaan internet dan server *world wide web*. Bioinformatika menjadi penting karena perkembangan teknologi informasi dan peningkatan ilmu komputer, khususnya pada bidang biologi molekuler, membuka sudut pandang baru dalam menyelesaikan persoalan biologi molekuler (Baxevanis dan Oullete, 2001).

2.14 Database

Kumpulan data yang diatur sedemikian rupa untuk memudahkan penggunanya. Pada database bioinformatika, data yang diatur merupakan data sekuen DNA atau protein yang didapat melalui percobaan laboratorium

yang biasanya disimpan dalam file komputer. Setiap file dari suatu sekuen berisi informasi mengenai asal organisme, nama sekuen, dan juga nomor akses yang digunakan untuk mengidentifikasi sekuen tersebut. (Mount, 2004)

GenBank merupakan suatu institusi yang menyimpan dan mengelola database urutan DNA suatu gen dan ekspresi asam aminonya. Urutan DNA diperoleh dari berbagai penelitian yang dengan sukarela memberikan hasil penelitiannya untuk masyarakat umum. GenBank didirikan oleh *National Center for Biotechnology Information* (NCBI) bersama dengan DNA *Data Bank of Japan* (DDBJ) dan *European Bioinformatics Institute* (EBI). Diantara format-format database yang ada, GenBank Flatfile Format (GBFF) dan FASTA merupakan format yang umum digunakan pada Bioinformatika. (Baxevanis dan Oullete, 2001).

2.15 GenBank Flatfile Format (GBFF)

Format GBFF memiliki tiga bagian terpisah yaitu *header*, *feature*, dan sekuen . Bagian *header* berisi tentang informasi identitas organisme asal sekuen nukleotida atau asam amino seperti nama gen, waktu publikasi, nomor akses, produk ekspresi, dan nama peneliti yang memetakan sekuen nukleotida tersebut. Bagian feature memuat nama genus, spesies, jaringan, kromosom, galur, dan organisme asal sekuen beserta daerah gen, urutan asam amino yang disandi, dan nomor identitas produk proteinnya. Bagian terakhir GBFF merupakan bagian yang berisi susunan lengkap sekuen nukleotida atau protein dari organisme yang bersangkutan (Baxevanis dan

Oullete, 2001).

2.16 Format FASTA

Format FASTA terdiri atas definition line dan sekuen asam amino atau nukleotida. Format ini merupakan format input (*query sequence)* untuk berbagai program analisis bioinformatika. Format FASTA tergolong kurang informatif dibandingkan format lainnya, namun format ini lebih praktis jika digunakan dalam analisis sekuen (Baxevanis dan Oullete, 2001).

2.17 Format PDB

Format file yang berbasiskan teks yang memetakan koordinat dari suatu molekul sehingga dapat menggambarkan struktur tiga dimensi dari suatu molekul. Mayoritas informasi yang disimpan dalam format PDB adalah struktur tiga dimensi dari protein. Selain memetakan koordinat dari suatu molekul, format PDB juga dapat memuat informasi tentang peneliti yang telah memetakan struktur molekul tersebut (Baxevanis dan Oullete, 2001).

2.18 *Sequence Alignment*

Metoda penjajaran dua atau lebih sekuen nukleotida atau asam amino menggunakan algoritma tertentu dengan bantuan komputer, sehingga didapatkan area yang memiliki urutan relatif identik satu sama lain. Metoda ini berfungsi mencari homologi antar sekuen nukleotida atau asam amino. Konsertivitas menunjukan adanya hubungan evolusi antara dua atau lebih

sekuen nukleotida yang mengalami perubahan akibat substitusi, insersi, dan delesi (Baxevanis dan Oullete, 2001).

Sequence Alignment dibagi menjadi dua jenis berdasarkan jumlah sekuen yang digunakan sebagai input. *Pairwise sequence alignment* melibatkan dua sekuen, sedangkan *multiple sequence alignment* melibatkan lebih dari dua sekuen. *Multiple sequence alignment* memberikan hasil yang lebih akurat dan representatif dibandingkan *pairwise sequence alignment* karena peningkatan jumlah input sekuen meningkatkan kepercayaan dan akurasi output. Peningkatan jumlah sekuen yang dimasukkan berarti meningkatkan kompleksitas proses sequence alignment (Baxevanis dan Oullete, 2001).

2.19 *Database Similarity Searching*

Sequence alignment digunakan untuk membandingkan pasangan sekuen yang spesifik. Jika suatu sekuens yang belum diketahui pembandingnya maka digunakan *Database Similarity Searching.* Metode ini akan mencari kecocokan sekuens input terhadap *database* dan hasilnya berupa suatu daftar beserta berbagai nilai dan statistik (Baxevanis dan Oullete, 2001).

Program *Basic Local Alignment Search Tool* (BLAST) dikembangkan sesuai dengan tipe sekuen *query* dan *subject*, protein atau nukleotida. Jika tipe sekuen berbeda, sekuen nukleotida akan terlebih dahulu ditranslasikan oleh program. BLASTp digunakan untuk *query* protein terhadap *subject*

protein. BLASTn digunakan untuk *query* nukleotida (ditranslasikan) terhadap *subject* protein. TBLASTn digunakan untuk *query* protein terhadap *subject* nukleotida (ditranslasikan). TBLASTx digunakan untuk *query* dan *subject* berupa nukleotida, tetapi keduanya ditranslasikan terlebih dahulu kemudian dibandingkan sebagai protein.

2.20 Prediksi *Conserved Region*

Metoda ini untuk mendapatkan daerah sekuen yang memiliki similaritas antar nukleotida atau asam amino yang rapat. *Hasil conserved region* dapat diinterpretasikan bahwa sekuen tersebut berperan vital dalam aktivitas biologis karena tetap dipertahankan selama proses evolusi berlangsung. Jika *conserved region* tersebut menyandi suatu protein, kemungkinan besar ia menyandi pusat aktif enzim yang umumnya tidak berubah selama protein tersebut mempunyai fungsi yang sama. Tidak tertutup kemungkinan bahwa *conserved region* itu terbentuk dari sekuen nukleotida non fungsional yang belum berubah sehingga menyandikan area yang tidak memiliki fungsi penting pada protein (Baxevanis dan Oullete, 2001).

2.21 *Molecular Docking*

Metode untuk mencari posisi optimal molekul *ligand* terhadap sisi aktif pengikatan dari struktur target (*receptor*). *Molecular Docking* dapat memprediksikan afinitas pengikatan kompleks yang terbentuk antara *receptor*

dengan ligand menggunakan berbagai skor sperti ΔG° binding, *Konstanta Inhibition*, ikatan hidrogen dan kontak hidrofobik. *Molecular Docking* sangat berguna dalam proses *Drug Design*, seperti untuk memprediksi afinitas pengikatan dari inhibitor yang didesain terhadap enzim tertentu yang ingin dihambat aktivitasnya (Yeturu & Nagasuma, 2008)

BAB III

METODE PENELITIAN

Penelitian dilakukan menggunakan metode *in silico* yang memanfaatkan perangkat komputer dan data-data yang tersedia di database. Data-data digunakan untuk dianalisis dan diinterpretasikan dengan berbagai software yang didukung oleh ketersedian jaringan internet. Secara garis besar, penelitian ini dilakukan dengan pencarian sekuen, *multiple alignment,* pencarian struktur tiga dimensi, *superimpose*, dan *molecular docking*.

3.1 Pencarian dan Pemilihan Sekuen

Sekuen Hemagglutinin dari subtipe H1N1, H2N2, H3N2, H5N1 di*download* dari *Influenza Virus Resource database* yang disediakan oleh N*ational Center for Biotechnology Information* (NCBI) dan dapat diakses melalui *http://ncbi.nlm.nih.gov/genomes/FLU/Database.html*. Sekuen yang didownload adalah sekuen isolat asal bebek dan manusia dengan format FASTA. Pemilihan sekuen didasarkan pada tahun ketika terjadi pandemik dan untuk H5N1 pada tahun awal kemunculan serta strain yang sering digunakan untuk sampel penelitian.

3.2 Multiple Alignment

Sekuen dari tiap subtipe dialignment menggunakan program Clustal W2 antara isolat dari bebek dan manusia. Program Clustal W2 disediakan

secara online dengan mengakses *www.ebi.ac.uk/Tools/clustalw2/index.html*. Hasil *alignment* diinterpretasikan untuk mengetahui posisi asam amino yang berbeda pada *Region Receptor Binding Domain* antara isolat asal bebek dan manusia untuk tiap subtipe. Proses *editing alignment* digunakan *software* Bioedit.

3.3 Pencarian Struktur tiga dimensi.

Pencarian dilakukan dengan melakukan *Basic Local Alignment Search Tools* (BLAST) antara sekuen *Hemagglutinin* asal isolat bebek dan manusia tiap subtipe terhadap database struktur tiga dimensi yang dapat diakses melalui *www.rcsb.org/pdb/static.do?p=search/index.html*. Struktur tiga dimensi yang dipilih adalah yang mempunyai kesamaan 100 % terhadap *Receptor Binding Domain* sekuen *Hemagglutinin* yang telah dipilih sebelumnya. Kemudian didownload juga struktur tiga dimensi dari Sia(α2-3)Gal dan Sia(α2-6)Gal yang mewakili reseptor sel permukaan dari host bebek dan manusia.

3.4 Superimpose Struktur Tiga Dimensi

Struktur tiga dimensi dari *Receptor Binding Domain* asal isolat bebek dan manusia untuk tiap subtipe dilakukan superimpose menggunakan *software* Pymol. Berdasarkan hasil super impose akan dilihat keterkaitan struktur tiga dimensi *Receptor Binding Domain Hemagglutinin* asal isolat

bebek dan manusia dalam satu subtipe menggunakan nilai *Root Mean Square Deviation* (RMSD). Analisis juga dilakukan terhadap kedekatan struktur *Receptor Binding Domain* antara subtipe H5 dengan subtipe H3 dan H1.

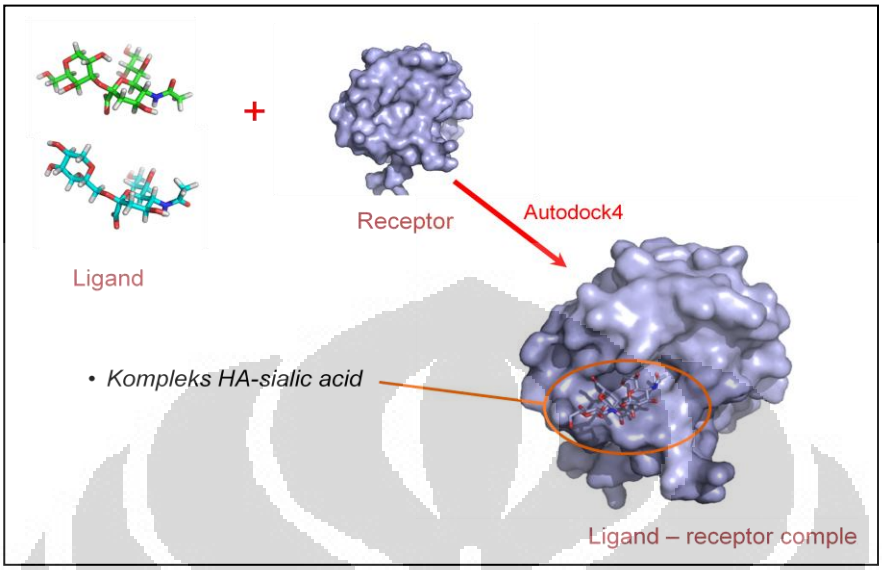
3.5 Molecular Docking

Setiap struktur tiga dimensi *Hemagglutin* dilakukan *Molecular Docking* terhadap reseptor Sia(α2-3)Gal dan Sia(α2-6)Gal. Sebelum dilakukan *Molecular Docking*, terlebih dahulu dilakukan preparasi awal terhadap struktur *Macromolecule* (*Hemagglutinin)* dan struktur *Ligand* (Sia α2-3 Gal dan Siaα2-6Gal). Preparasi yang dilakukan adalah Penghapusan molekul air, penambahan atom Hidrogen, penghitungan *Charges* dan proses minimasi (metode Conjugate Gradient) menggunakan *software* VegaZZ.

Program *Molecular Docking* yang digunakan adalah Autodock4 dengan bantuan program Autogrid4, dan Auto Dock Tools. Program Auto Dock Tools digunakan untuk pembuatan parameter-parameter yang diperlukan oleh program Autodock4 dan Autogrid4.

Autodock4 akan mengevaluasi kompleks yang terjadi antara *Hemagglutinin* dengan Sia(α2-3)Gal dan Sia(α2-6)Gal dengan nilai ΔG°*binding* dan *Konstanta Inhibition*. Selanjutnya hasil *molecular docking* divisualisasikan menggunakan *Software* Pymol untuk melihat interaksi dan kompleks yang terbentuk antara *Hemagglutinin* dengan Sia(α2-3)Gal dan

Sia(α2-6)Gal.



Gambar 8. Skema perancangan simulasi *Molecular Docking*

BAB IV

HASIL DAN PEMBAHASAN

4.1 Pencarian Sekuen Hemagglutinin

Sekuen protein *Hemagglutinin* Virus Influenza A yang digunakan sebagai bahan penelitian adalah sekuen yang berasal dari subtipe H1N1, H2N2, H3N2, dan H5N1. Pemilihan subtipe H1N1, H2N2, dan H3N2 dikarenakan subtipe ini telah menyebabkan pandemik global. Kemampuan menyebabkan pandemik menunjukan bahwa subtipe H1N1, H2N2, dan H3N2 asal isolat manusia memiliki kemampuan mengenali Sia(α2-6)Gal sehingga mampu menyebar antar manusia secara mudah. Berdasarkan hal ini, sekuen protein *Hemagglutinin* subtipe H1N1, H2N2, dan H3N2 asal isolat manusia yang berasal dari tahun terjadinya pandemik dapat dijadikan sampel protein *Hemagglutinin* yang mengenali reseptor Sia(α2-6)Gal.

Hemagglutinin yang berasal dari isolat unggas mampu mengenali Sia(α2-3)Gal yang merupakan reseptor sel permukaan paling dominan pada unggas. Pada *host* unggas juga terdapat reseptor sel permukaan Sia(α2-6)Gal, seperti pada ayam dan burung puyuh. Berbeda dengan ayam dan burung puyuh, bebek hanya memiliki reseptor sel permukaan Sia(α2-3)Gal. Berdasarkan hal ini, sekuen protein *Hemagglutinin* yang berasal dari isolat bebek dapat dijadikan sampel protein *Hemagglutinin* yang mengenali Sia(α2-6)Gal.

Subtipe H5N1 merupakan virus Influenza yang dikhawatirkan dapat menjadi pandemik. Subtipe H5N1 telah mampu menginfeksi manusia dan memiliki patogenesitas yang tinggi, namun belum mampu menyebar antar manusia. Sampel yang digunakan untuk mewakili subtipe H5N1 berasal dari tahun 1997 yang merupakan awal kemunculan subtipe ini dan sekuen yang telah sering digunakan oleh beberapa penelitian.

Pada tahun 2009, virus Influenza subtipe H1N1 kembali merebak dan lembaga WHO telah menetapkan phase 6 untuk virus ini. Phase 6 menunjukan bahwa telah terjadi pandemik global. Oleh karena itu, analisis Hemagglutinin pada strain virus ini perlu dilakukan untuk melihat keterkaitan terhadap subtipe H1N1 yang telah menyebabkan pandemik pada tahun 1918-1919.

Pencarian sekuen protein *Hemagglutinin* dilakukan pada server database *GenBank* yang diakses melalui *Influenza Virus Resource* pada website *National Center for Biotechnology Information* (*http://ncbi.nlm.nih.gov/genomes/FLU/Database.html*). Format yang terdapat pada database tersebut berbentuk *GenBank Flatfile Format* (GBFF). Format ini terdiri atas *Header*, *Feature*, serta sekuen nukleotida dan protein. *Software* Bioinformatika memerlukan input file dengan format FASTA. Format FASTA hanya berisi *definition line* dan sekuen asam amino menggunakan kode satu huruf. Oleh karena itu, format file terlebih dahulu dirubah menjadi format FASTA sebelum di*download*.

A/duck/Zhejiang/11/2000(H5N1)	A/Viet Nam/1203/2004(H5N1)

Hasil pencarian sekuen didapatkan total 40 sekuen *Hemagglutinin* yang di*download* sebagai sampel. Sekuen sampel dalam format FASTA dapat dilihat di Lampiran 3.

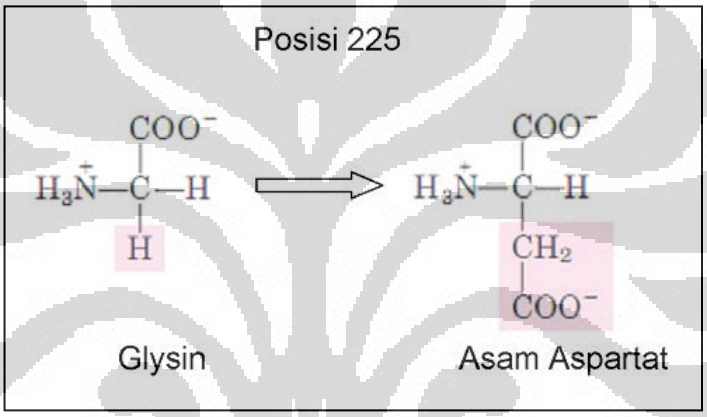
4.2 Multiple Sequence Alignment

Proses multiple sequence alignment dilakukan menggunakan program ClustalW2 yang diakses secara online melalui website *http://www.ebi.ac.uk/Tools/clustalw2/index.html.* Program ini akan menyejajarkan susunan asam amino sehingga dapat dianalisis mutasi-mutasi yang terjadi pada sekuen hemagglutinin asal isolat bebek dan manusia untuk setiap subtipe. Penomoran posisi asam amino pada tiap strain mengikuti penomoran berdasarkan struktur tiga dimensi dari subtipe H3N2 untuk menghindari kerancuan penomoran yang berbeda dari tiap subtipe. Analisis yang dilakukan terhadap mutasi hanya akan dibatasi pada asam amino yang berperan dalam *Receptor Binding Domain* (RBD). Posisi *Receptor Binding Domain* berada pada 130 loop (residu 134-138), 190 helix (residu 190-198), dan 220 loop (residu 221-228). Perhatian khusus diberikan untuk posisi 190, 225, 226, dan 228 karena posisi ini berinteraksi langsung terhadap pengikatan reseptor *sialic acid.*

Tabel 2. Hasil analisis *sequence alignment*

Posisi AA	H1		H2		H3		H5	
	Bebek	Manusia	Bebek	Manusia	Bebek	Manusia	Bebek	Manusia
190	E	D	E	E	E	E	E	E
225	G	D	G	G	G	G	G	G
226	Q	Q	Q	L	Q	L	Q	Q
228	G	G	G	S	G	S	G	G

Hasil dari Alignment antara isolat asal bebek dan manusia untuk subtipe H1N1 menunjukan bahwa terjadi mutasi pada posisi 225 dan 190. Pada posisi 225 dari *Hemagglutinin* asal isolat bebek memiliki asam amino Glysin (G) sedangkan pada *Hemagglutinin* asal isolat manusia memiliki asam amino Asam Aspartat (D). Mutasi terjadi dari asam amino yang memiliki karakteristik *Hidrofobik* menjadi asam amino yang *Hidrofilik* dan bermuatan negatif.

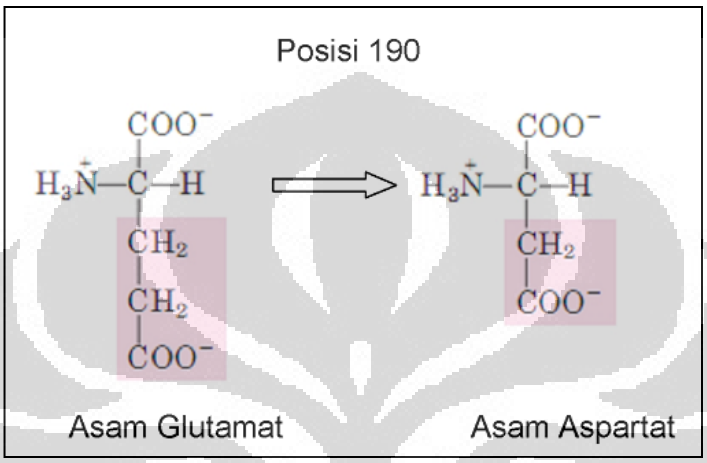


Gambar 9. Mutasi RBD dari isolat bebek ke manusia pada subtipe H1N1

Pada posisi 190 terjadi mutasi dari asam amino Asam Glutamat (E) pada isolat bebek menjadi Asam Aspartat (D) pada isolat manusia. Kedua asam amino ini memiliki karakteristik hampir sama dan hanya sedikit berbeda ukuran. Asam Glutamat asal isolat bebek memiliki 1 atom C lebih banyak dibandingkan Asam Aspartat pada isolat manusia.

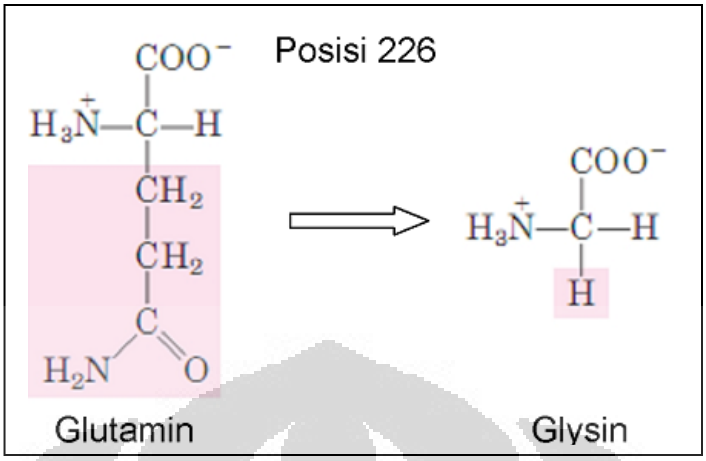
Hemagglutinin subtipe H1N1 isolat tahun 2009 memiliki susunan asam amino *Receptor Binding Domain* yang sama dengan subtipe H1N1 isolat manusia tahun 1918. Hal ini menunjukan bahwa sekuen *Hemagglutinin* isolat

manusia tahun 2009 telah mampu mengenali reseptor Sia(α2-6)Gal. Hal ini juga dibuktikan dengan keadaan saat ini yang telah menjadi pandemik global, meskipun tidak memakan korban jiwa sebanyak ketika pandemik tahun 1918 terjadi.

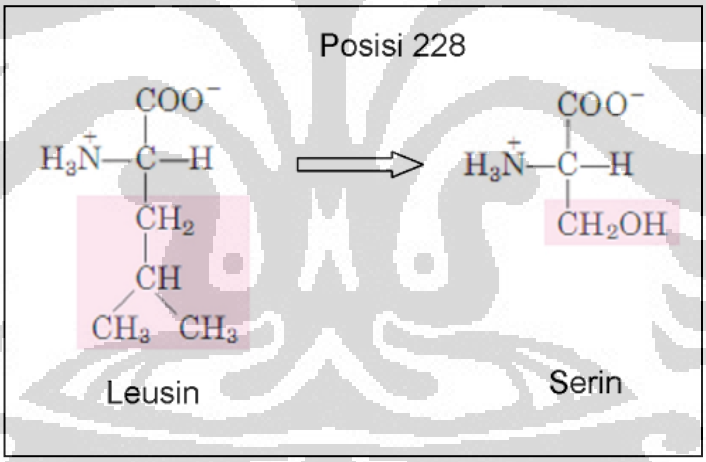


Gambar 10. Mutasi RBD dari isolat bebek ke manusia pada subtipe H1N1

Hasil *multiple alignment* untuk subtipe H2N2 dan H3N2 menunjukan terdapat mutasi pada posisi 226 dan 228 antara isolat bebek dan manusia. Isolat bebek memiliki asam amino Glutamin (Q) pada posisi 226 dan Glysin (G) pada posisi 228. Isolat asal manusia memiliki asam amino Leusin (L) pada posisi 226 dan Serin (S) pada posisi 228. Pada posisi 226, asam amino Glutamin asal isolat bebek memiliki karakteristik *hidrofilik*, sedangkan Leusin asal isolat manusia memilki karakteristik *hidrofobik*. Pada posisi 228, asam amino Glysin asal isolat bebek memiliki karakteristik *hidrofobik*, sedangkan asam amino Serin asal isolat manusia bersifat *Hidrofilik*.



Gambar 11. Mutasi RBD isolat bebek ke manusia pada subtipe H2N2 & H3N2



Gambar 12.Mutasi RBD isolat bebek ke manusia pada subtipe H2N2 & H3N2

Pada subtipe H5N1 tidak ditemukan adanya mutasi pada daerah *Receptor Binding Domain* antara isolat asal bebek dan manusia. Pada posisi 190 terdapat asam amino Asam Glutamat (E), sedangkan pada posisi 225,

226, dan 228 terdapat asam amino Glysin (G), Glutamin (Q), dan Gysin (G). Hal ini menunjukan bahwa subtipe H5N1 hanya mampu mengenali Sia(α2-3)Gal.

Berdasarkan kajian dari subtipe yang telah menjadi pandemik, kemungkinan subtipe H5N1 mampu mengenali Sia(α2-6)Gal jika terjadi mutasi pada asam amino posisi 190 dan 225 menjadi Asam aspartat. Kemungkinan lainnya jika terjadi mutasi pada posisi 226 dan 228 menjadi asam amino Leusin dan Serin.

4.3 Pencarian Struktur Tiga Dimensi Protein Hemagglutinin

Pencarian struktur tiga dimensi dilakukan melalui server yang diakses melalui *http://www.rcsb.org/pdb/static.do?p=search/index.html*. Pada server ini, pencarian struktur tiga dimensi dapat dilakukan dengan beberapa cara seperti memasukan kode *input* PDB, berdasarkan nama protein atau dengan membandingkan sekuen input terhadap database. Metode yang digunakan dalam penelitian ini adalah membandingkan sekuen *Hemagglutinin* yang telah dianalisis dengan *multiple alignment t*erhadap sekuen pada database yang telah diketahui strukturnya. Proses ini disebut *Basic Local Alignment Search Tool* (BLAST).

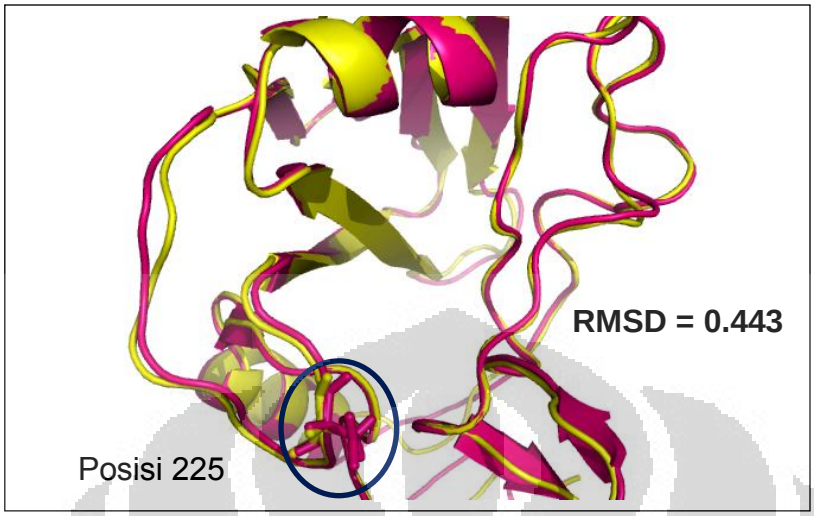
Struktur tiga dimensi yang dicari adalah *Hemagglutinin* asal isolat bebek dan manusia untuk subtipe H1, H3, dan H5. Struktur tiga dimensi yang dicari harus memiliki kesamaan 100% pada *Receptor Binding Domain* terhadap sekuen input.

Struktur yang didapatkan dari proses ini adalah 1RVT asal isolat babi dan 1RD8 asal isolat manusia untuk subtipe H1. 1MQN asal isolat bebek dan 1HGF asal isolat manusia untuk subtipe H3 serta 2FK0 untuk subtipe H5. File struktur tiga dimensi yang didownload berupa format PDB.

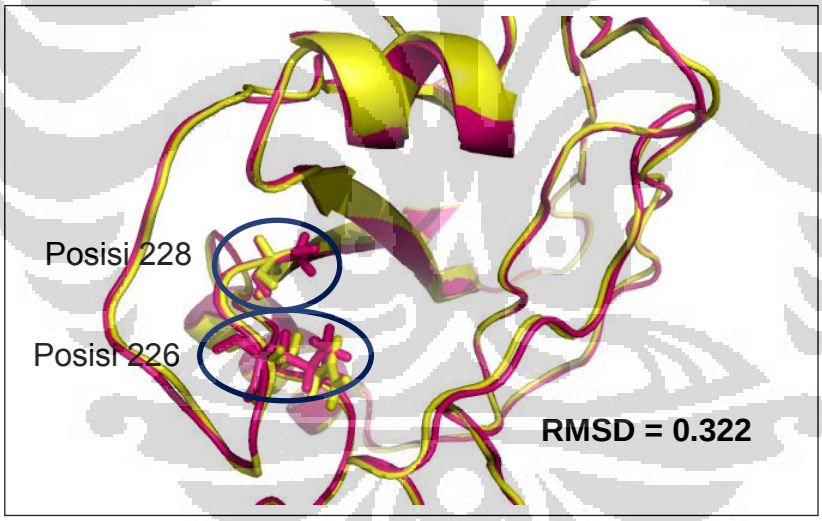
4.4 Superimpose Struktur Tiga Dimensi

Asam amino *backbone* yang terdapat di selain *Receptor Binding Domain* juga dapat mempengaruhi bentuk pelipatan celah dari *Receptor Binding Domain*. Karakteristik keterkaitan pelipatan celah dari *Receptor Binding Domain* asal isolat bebek dan manusia dilakukan untuk mengetahui seberapa besar peran dari asam amino *backbone* tersebut. Metode yang digunakan untuk memeriksa keterkaitan antar struktur adalah *superimpose* dan dilakukan menggunakan *software* Pymol. Pada metode ini, posisi Cα untuk tiap asam amino di bandingkan antara isolat bebek dan manusia dengan menggunakan nilai *Root Mean Square Deviation* (RMSD). Nilai RMSD ini akan berguna untuk menunjukan hubungan antar struktur yang dibandingkan.

Nilai RMSD dari hasil *superimpose* antara isolat bebek dengan isolat manusia pada subtipe H1 sebesar 0.604 Angstroms. Pada subtipe H3 sebesar 0.416 Angstroms dan pada subtipe H5 sebesar 0.573 Angstroms



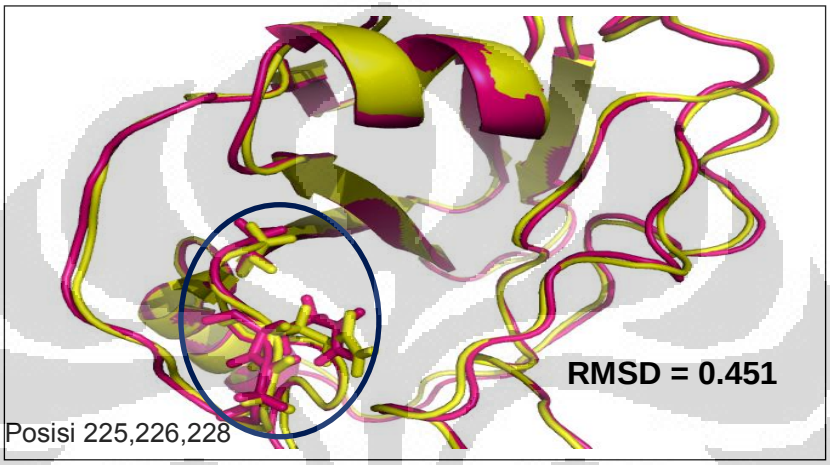
Gambar 13. *Superimpose* subtipe H1 isolat babi (kuning) & manusia (merah)



Gambar14.*Superimpose* subtipe H3 isolat bebek(kuning) & manusia (merah)

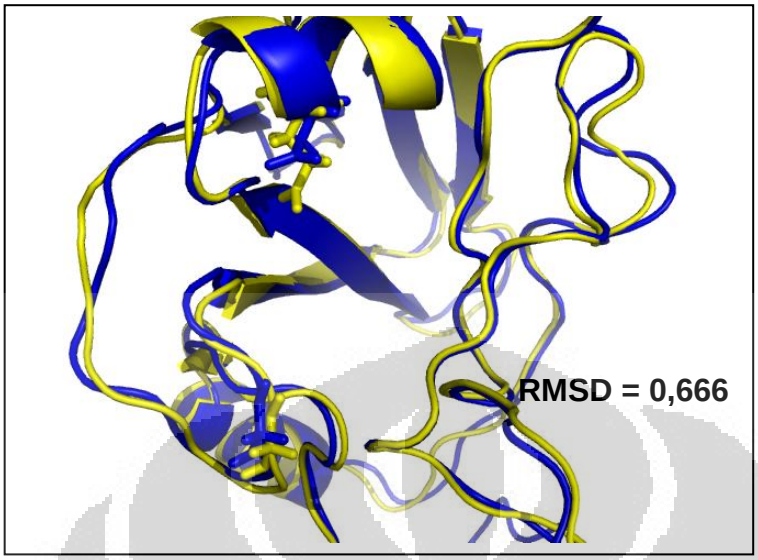
Hasil dari *superimpose* menunjukan bahwa struktur *Receptor Binding Domain* untuk isolat bebek dan manusia dalam satu subtipe memilki bentuk mirip. Hal ini menunjukan bahwa asam amino *backbone* dalam satu subtipe tidak secara signifikan mempengaruhi pola pelipatan celah dari *Receptor*

Binding Domain. Berdasarkan hal tersebut dapat diasumsikan bahwa spesifisitas *Hemagglutinin* dalam satu subtipe hanya dipengaruhi oleh susunan asam amino pada *Receptor Binding Domain* yang berinteraksi secara langsung dengan reseptor sel *sialic acid*.

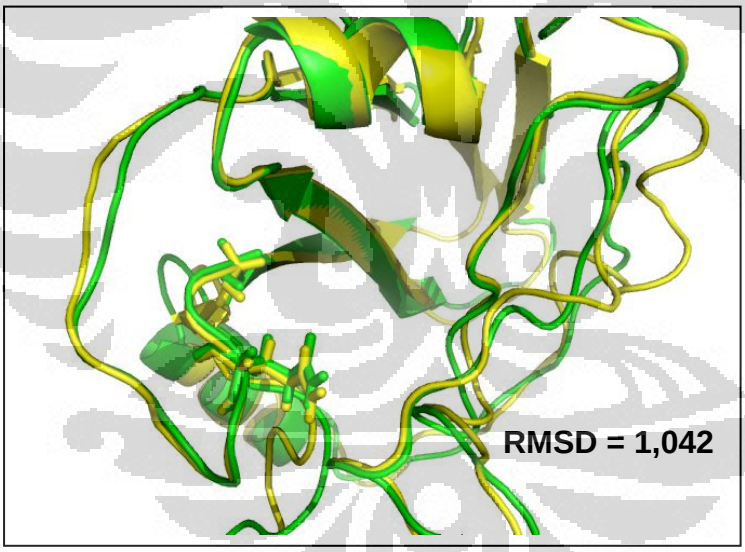


Gambar 15.*Superimpose* subtipe H5 isolat bebek (kuning) & manusia(merah)

Hasil *superimpose* untuk struktur *Receptor Binding Domain* antara subtipe H1 dengan H5 menghasilkan nilai RMSD sebesar 0,666 Angstroms. Pada subtipe antara H5 dan H3 menghasilkan nilai RMSD 1,042 Angstroms. Berdasarkan hasil ini didapatkan kesimpulan bahwa struktur *Receptor Binding Domain* subtipe H5 memiliki keterkaitan struktur lebih dekat dengan subtipe H1 dibandingkan dengan subtipe H3. Hal ini sekaligus mendukung pernyataan, Ridlo 2008, mengenai kedekatan subtipe H5N1 terhadap subtipe H1N1 dibandingkan dengan H3N2 dengan menggunakan analisis *phylogenetic tree*



Gambar 16.*Superimpose* antara subtipe H5(kuning) dengan subtipe H1 (biru)



Gambar 17.*Superimpose* antara subtipe H5(kuning) dengan subtipe H3(hijau)

4.5 Molecular Docking

Struktur tiga dimensi yang telah di*download* kemudian dilakukan simulasi *molecular docking* terhadap ligand Sia(α2-3)Gal dan Sia(α2-6)Gal.

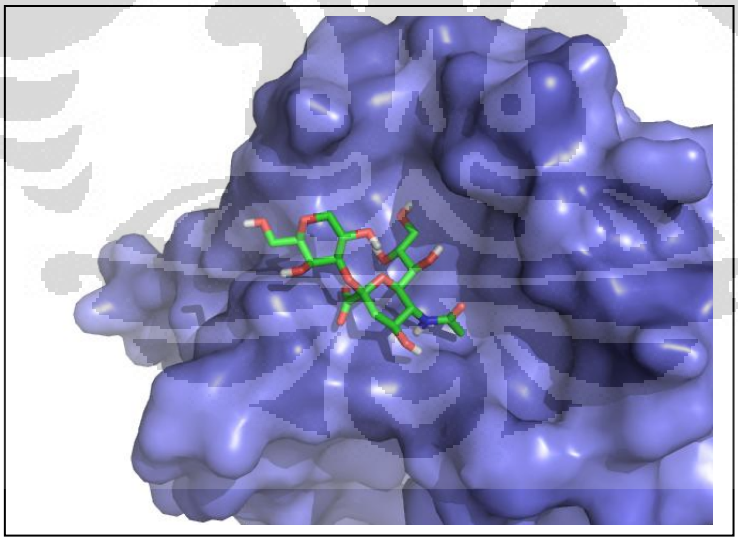
Simulasi *molecular docking* menggunakan software Autodock4 dengan *Lamarckian-Genetic Algorithm* dan hasil docking divisualisasikan menggunakan software Pymol. Kompleks yang terbentuk antara *Hemagglutinin* dengan Sia(α2-3)Gal dan Sia(α2-3)Gal mempunyai nilai perkiraan ΔG°*binding* dan *Konstanta Inhibition* yang dihitung oleh program Autodock.

Tabel 3. Hasil perkiraan ΔG°*binding* dan *Konstanta Inhibition*

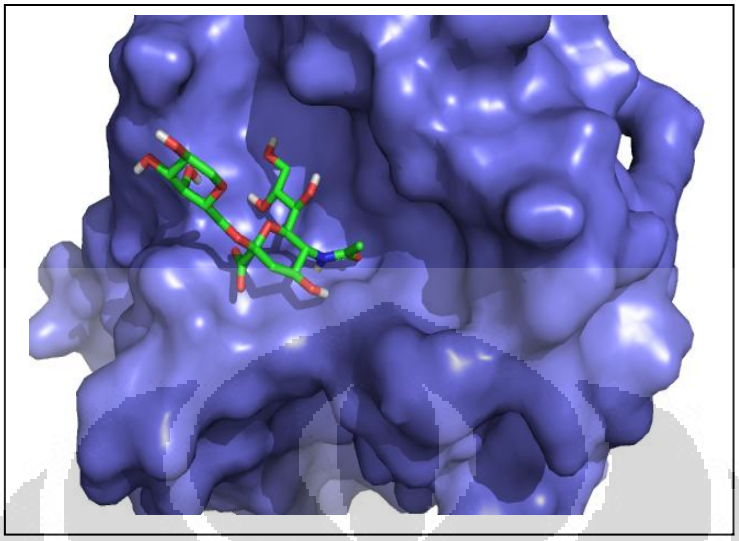
Subtipe H1N1		
1RVT (babi) - Sia(α2-3)Gal	ΔG°*binding*	-1.37 kcal/mol
	Ki	99.71 mM
1RVT (babi) - Sia(α2-6)Gal	ΔG°*binding*	-1.98 kcal/mol
	Ki	35.67 mM
1RD8 (manusia) - Sia(α2-3)Gal	ΔG°*binding*	-1.86 kcal/mol
	Ki	43.12 mM
1RD8 (manusia) - Sia(α2-6)Gal	ΔG°*binding*	-1.99 kcal/mol
	Ki	34.75 mM
Subtipe H3N2		
1MQN (bebek) - Sia(α2-3)Gal	ΔG°*binding*	-1.06 kcal/mol
	Ki	166.46 mM
1MQN (bebek) - Sia(α2-6)Gal	ΔG°*binding*	-1.59 kcal/mol
	Ki	68.55 mM
1HGF (manusia) - Sia(α2-3)Gal	ΔG°*binding*	-0.75 kcal/mol
	Ki	283.94 mM
1HGF (manusia) - Sia(α2-6)Gal	ΔG°*binding*	-0.20 kcal/mol
	Ki	716.54 mM
Subtipe H5N1		
2FK0 (manusia) - Sia(α2-3)Gal	ΔG°*binding*	-1.14 kcal/mol
	Ki	145.55 mM
2FK0 (manusia) - Sia(α2-6)Gal	ΔG°*binding*	-1.50 kcal/mol
	Ki	79.72 mM

Berdasarkan nilai ΔG°*binding* dan *Konstanta Inhibition* tidak terjadi perbedaan signifikan antara kompleks asal isolat bebek dan dengan asal isolat manusia. Hal ini mengakibatkan nilai ΔG°*binding* dan *Konstanta Inhibition* hasil output dari program Autodock tidak dapat dijadikan acuan untuk menentukan spesifitas *Hemagglutinin.*

Penentuan spesifitas harus dilakukan dengan melihat secara manual dan meneliti kompleks yang terbentuk. Apabila residu *sialic acid* dapat memasuki celah Receptor Binding Domain (RBD) maka dapat disimpulkan bahwa *Hemagglutinin* mampu berikatan dengan reseptor *sialic acid* tersebut. Pada *Hemagglutinin* yang tidak memilki kecocokan dengan reseptor *sialic acid* terbentuk kompleks yang menunjukan residu *sialic acid* tidak dapat memasuki celah RBD.

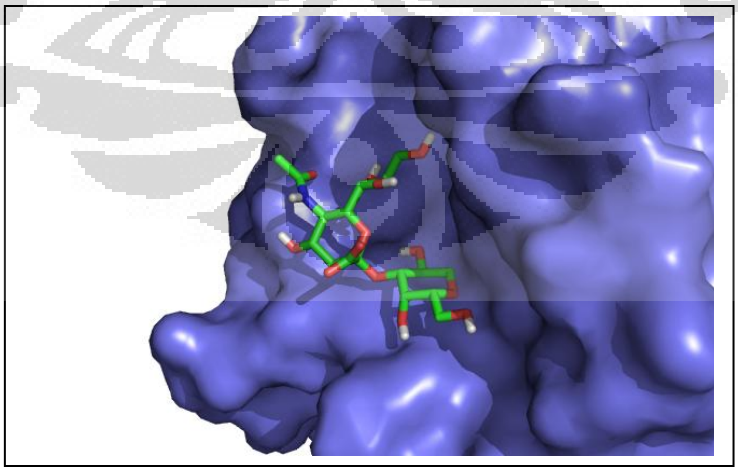


Gambar 18. Kompleks Hemagglutinin 1RVT dengan Sia(α2-3)Gal

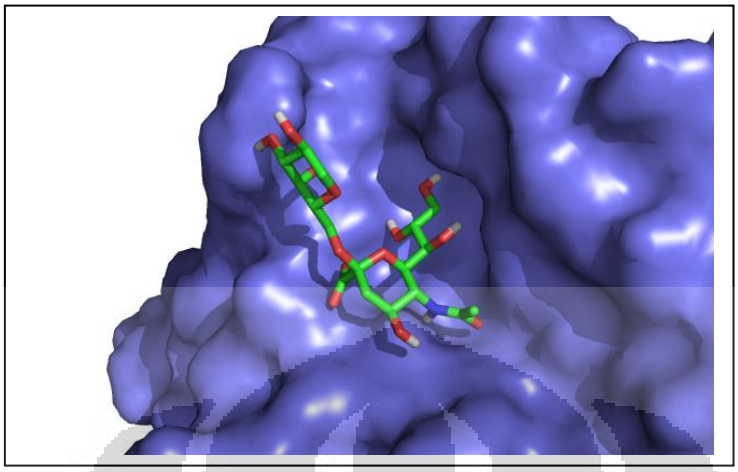


Gambar 19. Kompleks Hemagglutinin 1RVT dengan Sia(α2-6)Gal

Berdasarkan hasil visualisasi kompleks dari *molecular docking* pada subtipe H1 didapatkan bahwa struktur 1RVT (isolat babi) dapat berikatan dengan *ligand* Sia(α2-3)Gal dan Sia(α2-6)Gal. Hal ini terlihat dari hasil kompleks yang divisualisasikan menunjukan bahwa residu *sialic acid* dari Sia(α2-3)Gal dan Sia(α2-6)Gal dapat memasuki celah RBD.



Gambar 20. Kompleks Hemagglutinin 1RD8 dengan Sia(α2-3)Gal

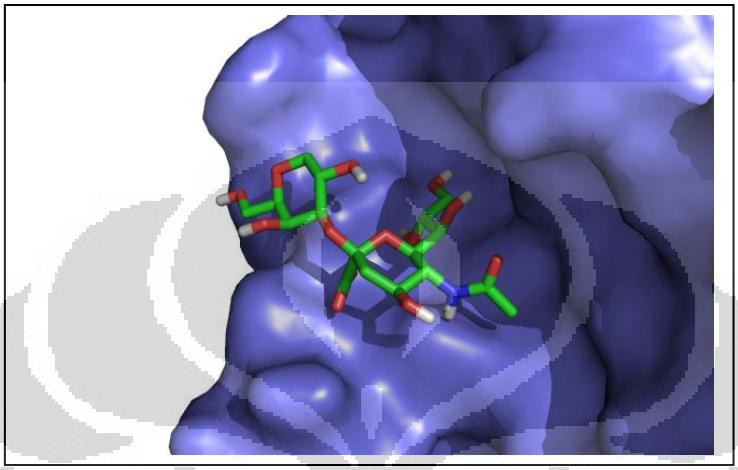


Gambar 21. Kompleks Hemagglutinin 1RD8 dengan Sia(α2-6)Gal

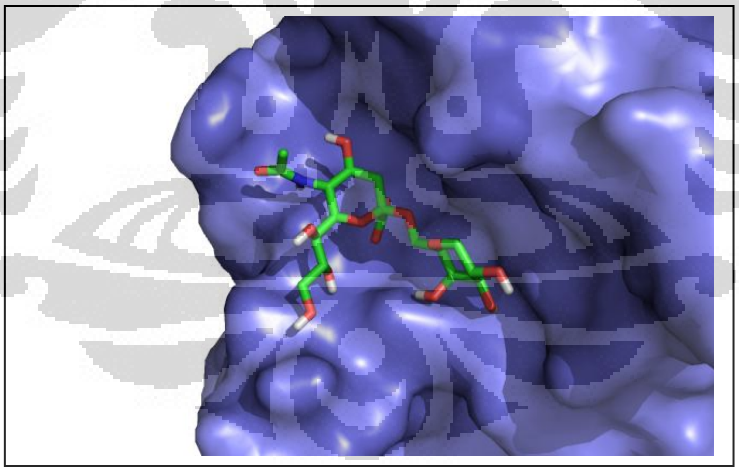
Hal berbeda ditunjukan pada kompleks antara 1RD8 (isolat manusia) dengan Sia(α2-3)Gal dan Sia(α2-6)Gal. Kompleks yang terjadi antara 1RD8 dengan Sia(α2-3)Gal menunjukan bahwa residu *sialic acid* dari Sia(α2-3)Gal tidak dapat memasuki celah dari RBD. Berdasarkan hal ini dapat diperkirakan bahwa Sia(α2-3)Gal tidak mampu berikatan dengan 1RD8. Hal berbeda terjadi pada kompleks antara 1RD8 dengan Sia(α2-6)Gal. Pada kompleks tersebut terlihat bahwa residu *sialic acid* dapat memasuki celah RBD. Berdasarkan hal ini dapat disimpulkan bahwa struktur *Hemagglutinin* 1RD8 memiliki spesifitas terhadap reseptor Sia(α2-6)Gal.

Hasil *molecular docking* untuk subtipe H3 menunjukan bahwa struktur 1MQN (asal isolat bebek) memiliki spesifitas terhadap Sia(α2-3)Gal. Hal tersebut dapat dilihat berdasarkan kompleks yang terbentuk dengan Sia(α2-3)Gal dan Sia(α2-6)Gal. Pada kompleks dengan Sia(α2-3)Gal terlihat bahwa gugus residu *sialic acid* memasuki celah RBD, namun hal ini tidak

terjadi pada kompleks dengan Sia(α2-6)Gal. Residu *sialic acid* dari Sia(α2-6)Gal hanya tepat berada di depan celah RBD tanpa mampu memasukinya.



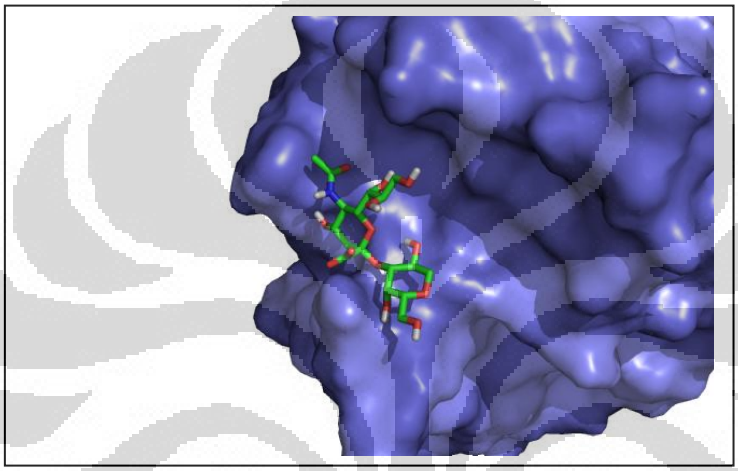
Gambar 22. Kompleks *Hemagglutinin* 1MQN dengan Sia(α2-3)Gal



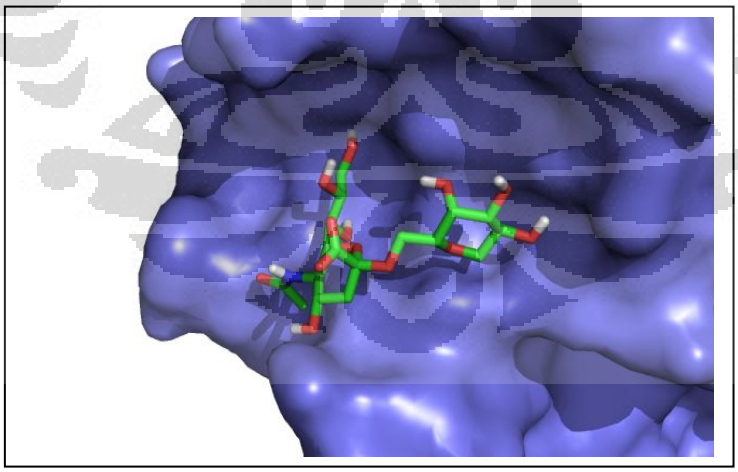
Gambar 23. Kompleks *Hemagglutinin* 1MQN dengan Sia(α2-6)Gal

Pada struktur 1HGF (asal isolat manusia) yang masih termasuk subtipe H3, memilki spesifitas berbeda dengan 1MQN (asal isolat bebek).

1HGF memiliki spesifitas terhadap Sia(α2-6)Gal. Pada kompleks 1HGF dengan Sia(α2-3)Gal dan Sia(α2-6)Gal menunjukan hal berlawanan dengan kompleks 1MQN. Residu *sialic acid* Sia(α2-3)Gal tidak mampu memasuki celah RBD sedangkan residu *sialic acid* Sia(α2-6)Gal mampu memasuki RBD.

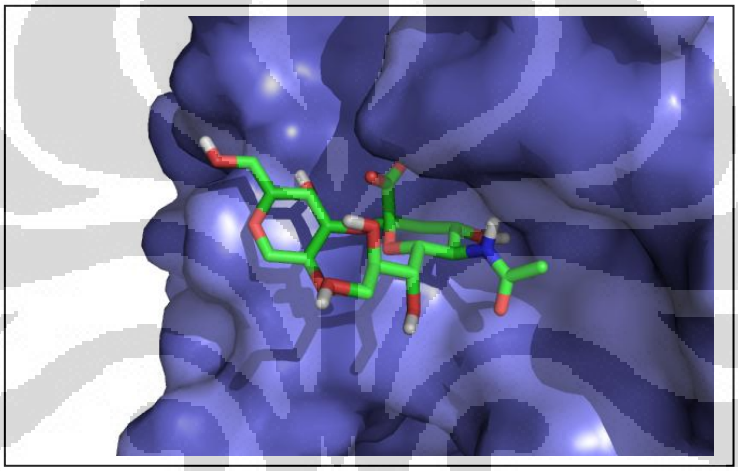


Gambar 24. Kompleks *Hemagglutinin* 1HGF dengan Sia(α2-3)Gal

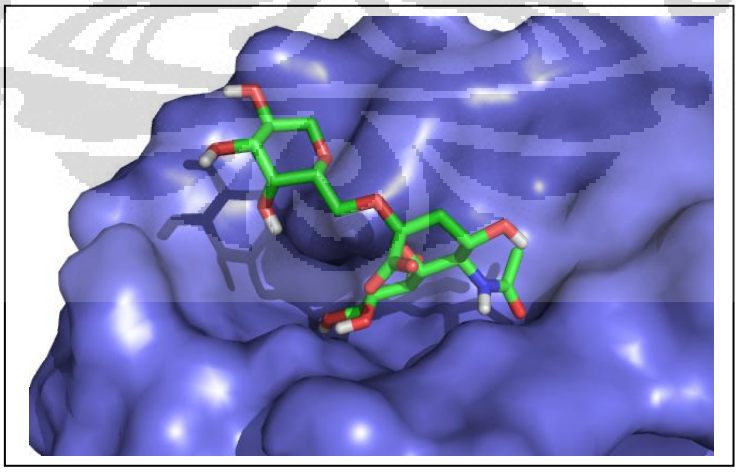


Gambar 25. Kompleks *Hemagglutinin* 1HGF dengan Sia(α2-6)Gal

Pada struktur 2FK0 asal isolat manusia yang juga memiliki susunan asam amino RBD yang sama dengan asal isolat bebek menunjukan spesifitas terhadap Sia(α2-3)Gal. Kompleks yang terbentuk menunjukan residu *sialic acid* dari Sia(α2-3)Gal mampu memasuki celah sempit RBD namun residu *sialic acid* dari Sia(α2-6)Gal terlihat hanya mampu sedikit memasuki celah RBD.



Gambar 26. Kompleks *Hemagglutinin* 2FK0 dengan Sia(α2-3)Gal



Gambar 27. Kompleks *Hemagglutinin* 2FK0 dengan Sia(α2-6)Gal

Hasil *molecular docking* dengan autodock berhasil memprediksikan spesifitas *Hemagglutinin* melalui evaluasi kompleks yang terbentuk meskipun gagal dalam memprediksikan spesifitas melalui nilai ΔG°*binding* dan *Konstanta Inhibition.* Hasil penelitian ini dapat dijadikan salah satu dasar dilakukannya uji spesifitas dari sekuen *Hemagglutinin* yang belum diuji di laboratorium melalui metode komputasional. Penggabungan metode *homology modelling* dan *molecular docking* terhadap suatu sekuen *Hemagglutinin* dapat memprediksikan spesifitas dari suatu *Hemagglutinin* dengan cepat dan murah. Selanjutnya hasil dari penelitian ini diharapkan dapat dijadikan informasi awal dalam perancangan inhibitor yang mampu menghalangi pengikatan *Hemagglutinin* terhadap reseptor sel Sia(α2-6)Gal yang ada pada saluran pernapasan manusia.

BAB V

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Hasil *alignment* subtipe H1N1 menunjukan bahwa diperlukan mutasi asam amino pada posisi 190 dan 225 menjadi Asam Aspartat pada hemagglutinin untuk mengenali reseptor Sia(α2-6)Gal. Pada subtipe H2N2 dan H3N2 memerlukan mutasi yang berbeda dengan subtipe H1N1. Subtipe H2N2 dan H3N2 memerlukan mutasi asam amino pada posisi 226 dan 228 menjadi Leusin dan Serin untuk mengenali reseptor Sia(α2-6)Gal.

Berdasarkan Analisis mutasi terhadap *Hemagglutinin* yang telah menjadi pandemik, dapat diperkirakan bahwa *Hemagglutinnin* subtipe H5N1 memerlukan mutasi pada posisi 190 dan 225 menjadi Asam Aspartat untuk mengenali reseptor Sia(α2-6)Gal. Kemungkinan lain adalah memerlukan mutasi asam amino pada posisi 226 dan 228 menjadi Leusin dan Serin.

Metode simulasi *molecular docking* mampu membentuk kompleks antara *Hemagglutinin* dengan Reseptor Sia(α2-6)Gal dan Sia(α2-3)Gal. Berdasarkan hasil kompleks yang terbentuk, metode simulasi *molecular docking* berhasil mengidentifikasi spesifitas Hemagglutinin terhadap Sia(α2-3)Gal atau Sia(α2-6)Gal

5.2 Saran

Simulasi *molecular docking* dapat dilakukan dengan menggunakan program selain autodock sebagai perbandingan. Perbandingan program *molecular docking* dapat lebih memastikan keberhasilan dari metode simulasi *molecular docking* untuk mengidentifikasi spesifitas *Hemagglutinin* terhadap Sia(α2-3)Gal atau Sia(α2-6)Gal.

Analisis *molecular mechanic* dan *molecular dynamic* perlu dilakukan lebih lanjut terhadap hasil docking yang telah dilakukan. Analisis *molecular mechanic* dan *molecular dynamic* dapat memberikan penjelasan lebih lanjut mengenai interaksi ikatan *Hemagglutinin* dengan reseptor *sialic acid*. Metode ini juga dapat meningkatkan keakuratan simulasi mekanisme pengikatan *Hemagglutinin* dengan reseptor *sialic acid*.

Lampiran 1. Tabel Asam Amino

A	Ala	Alanine	aliphatic hydrophobic neutral	GCT GCC GCA GCG	B		either aspartic acid or asparagine			
C	Cys	Cysteine	polar hydrophobic neutral	TGT TGC	D	Asp	Aspartic Acid	polar hydrophilic charged (-)	GAT GAC	E	Glu	Glutamic Acid	polar hydrophilic charged (-)	GAA GAG	F	Phe	Phenylalanine	aromatic hydrophobic neutral	TTT TTC	
G	Gly	Glycine		GGT GGC GGA GGG	H	His	Histidine	aromatic polar hydrophilic charged (+)	CAT CAC	I	Ile	Isoleucine	aliphatic hydrophobic neutral	ATT ATC ATA	K	Lys	Lysine		AAA AAG	
L	Leu	Leucine	aliphatic hydrophobic neutral	TTG TTA CTT CTC CTA CTG	
M	Met	Methionine	hydrophobic neutral	ATG	N	Asn	Asparagine	polar hydrophilic neutral	AAT AAC	P	Pro	Proline	hydrophobic neutral	CCT CCC CCA CCG	Q	Gln	Glutamine	polar hydrophilic neutral	CAA CAG	

R	Arg	Arginine	polar hydrophilic charged (+)	CGT CGC CGA CGG AGA AGG	S	Ser	Serine	polar hydrophilic neutral	TCT TCC TCA TCG AGT AGC	T	Thr	Threonine	polar hydrophilic neutral	ACT ACC ACA ACG	V	Val	Valine	aliphatic hydrophobic neutral	GTT GTC GTA GTG	W	Trp	Tryptophan	aromatic hydrophobic neutral	TGG	
					X		UNKNOWN			
Y	Tyr	Tyrosine	aromatic polar hydrophobic	TAT TAC	Z		either glutamic acid or glutamine			
	End	Terminator		TAA TAG	

Lampiran 2. Keterkaitan struktur berdasarkan nilai RMSD

RMSD(Å)	Structure Comparison Comment
>12	Completely Unrelated
7	Dubious relationship
5	May be structurally related
4	Good structural relationship
2	Closely related
1,5	Very Closely Related
0,8	Differences are not obvious
0,4	Essentially indistinguishable

(Baxevanis dan Oullete, 2001).

Lampiran 3. Sekuen Sampel Hemagglutinin dalam format FASTA

       Automated Docking of Flexible Ligand
        to Flexible Macromolecular Receptor
```

Number of distinct conformational clusters found = 3, out of 100 runs,
Using an rmsd-tolerance of 2.0 A

CLUSTERING HISTOGRAM

Clus-ter Rank	Lowest Binding Energy	Run	Mean Binding Energy	Num in Clus	Histogram 5 10 15 20 25 30 35
