HALAMAN PENGESAHAN

Karya Akhir ini diajukan oleh :
Nama : SANDI JANUAR PRIBADI
NPM : 6605523244
Program Studi : MAGISTER MANAJEMEN
Judul Karya Akhir : PERHITUNGAN PORTOFOLIO VALUTA
ASING DENGAN ESTIMASI VOLATILITAS
GARCH & EWMA PADA BANK ABC.

Telah berhasil dipertahankan di hadapan Dewan Penguji dan diterima sebagai bagian persyaratan yang diperlukan untuk memperoleh gelar Magister Manajemen pada Program Studi Magister Manajemen, Fakultas Ekonomi, Universitas Indonesia

DEWAN PENGUJI

Pembimbing : Dr. M. Muslich

Penguji : Sandra Chalik, MM

Penguji : Thomas H Secokusumo, MBA, MSc

Ditetapkan di : Jakarta

Tanggal : 23 Agustus 2008

KATA PENGANTAR

Ucapan rasa syukur kepada Allah SWT karena ridhoNya-lah karya akhir ini dapat diselesaikan. Karya akhir dengan judul “Pengukuran VaR Portofolio Valuta Asing dengan Estimasi Volatilitas GARCH dan EWMA pada PT Bank ABC” disusun sebagai salah satu persyaratan akademis di Program Studi Magister Manajemen, Fakultas Indonesia.

Penyusunan karya akhir ini tentunya tidak akan berhasil tanpa peran serta berbagai pihak. Selanjutnya penulis ucapkan terima kasih pula kepada:

1. Bapak Rhenald Kasali, PhD selaku Ketua Program Magister Manajemen, Fakultas Ekonomi, Universitas Indonesia
2. Bapak Dr. Muhammad Muslich selaku pembimbing penulis yang telah sabar menyediakan waktu, tenaga dan pikiran untuk memberikan pengarahan dalam penyusunan karya akhir ini.
3. Direksi, Pimpinan dan Staff PT Bank Rakyat Indonesia yang telah memberikan kesempatan penulis dalam memperoleh data dan waktu yang diperlukan penulis dalam penyelesaian karya akhir ini.
4. Kepada mamah dan papah (alm) yang selalu memberikan doa selama hidupnya.
5. Kepada Teteh dengan doa dan bantuan serta materil yang diberikan kepada penulis dan selalu menjadi pengganti orang tua setelah kepergian mamah dan papah.
6. Kepada seluruh keluarga besar Kak Ori, Aaip & Mba Peni, Teh Wida & Mas Rudi, A Budi & Ira serta seluruh keponakanku Bellys, Gadhia, Revin, Tiani, Dea, Kamil, Fiqi, Amel, Aci, Dilla, Alif, Keisha atas doa, dukungan, bantuan, pengertian dan pengorbanannya yang selalu diberikan kepada penulis.
7. Kepada MA yang selalu memberikan dukungan, dorongan, doa, kasih sayang dan cintanya sehingga penulis bisa menyelesaikan dan memperoleh kehidupan seperti sekarang ini.
8. Untuk Micky Mintarsyah yang selalu menjadi teman, sahabat, saudara dan selalu memberikan dorongan kepada penulis selama ini.

9. Teman teman FE UI, Uunk, Sofyan, Tere, Virgo, Yeni, Widi, Rosalin, Wihelvi yang selalu menjadi teman dari dulu sampai saat ini
10. Teman teman MMUI senasib sepenanggungan di Manajemen Risiko dan Pasar Modal yaitu Mba Rani, Pak Aziz, Andre, Toga dan teman teman MMUI yang lain yang tidak bisa disebutkan satu persatu.
11. Kepada adiku Mega yang selalu siap membantu penulis, Sahabatku Kunto yang menjadi sahabat di kala senang dan susah, Mas Harry, Anky dan Reza selalu menjadi teman penulis.
12. Teman teman di PALYJA, Mba Ria, Alin, Mba Emma, Fitri, Yoyong, Mba Swasti, Joseph, Chika, Pak Agus Ahmad, Mba Mala, Mba Maya, Ita juga teman teman di Tokio Marine, Venny, Yanti, Mas Fanni, Uphie, Mondang, Dini, Yunda, Wahyu, Mas Nasuka, Segoro, Mas Agus, Putri dan Pak Tjetjep juga di tempat kerja yang terakhir yaitu Pak Helmy dan Mba Yota atas pengertiannya kepada penulis selama penulis kerja di PMS.
13. Kepada seluruh karyawan MMUI, Mba Mini, Pak Herman, Mba Ratna, dan staff perpustakaan yang selalu memberikan kemudahan kepada penulis.
14. Semua pihak yang telah banyak membantu dengan tulus ikhlas yang tidak bisa disebut satu persatu

Jakarta, Agustus 2008

**HALAMAN PERNYATAAN PERSETUJUAN PUBLIKASI
TUGAS AKHIR UNTUK KEPENTINGAN AKADEMIS**

Sebagai sivitas akademik Universitas Indonesia, saya yang bertanda tangan di bawah ini:

Nama : Sandi Januar Pribadi
NPM : 660523244
Program Studi : Magister Manajemen
Fakultas : Ekonomi
Jenis karya : Tesis

demikian demi pengembangan ilmu pengetahuan, menyetujui untuk memberikan kepada Universitas Indonesia Hak *Bebas Royalti Noneksklusif Non-exclusive Royalty Free Right*) atas karya ilmiah saya yang berjudul:

PENGUKURAN VAR PORTOLIO VALUTA ASING
DENGAN ESTIMASI VOLATILITAS GARCH DAN EWMA
PADA PT BANK ABC

beserta perangkat yang ada (jika diperlukan). Dengan Hak Bebas Royalti Noneksklusif ini Universitas Indonesia berhak menyimpan, mengalihmedia/formatkan, mengelola dalam bentuk pangkalan data (database), merawat, dan memublikasikan tugas akhir saya tanpa meminta izin dari saya selama tetap mencantumkan nama saya sebagai penulis/pencipta dan pemilik Hak Cipta.

Demikian pernyataan ini saya buat dengan sebenarnya.

ABSTRAK

Nama : Sandi Januar Pribadi
Program Studi : Magister Manajemen
Judul : Pengukuran VaR Portfolio Valuta Asing Dengan Estimasi
Volatilitas GARCH dan EWMA pada PT Bank ABC

Pengelolaan risiko dan *return* merupakan kegiatan utama dalam perbankan. Krisis yang terjadi pada tahun 1997 merupakan contoh yang paling konkrit pengelolaan risiko dan *return* terburuk perbankan Indonesia, karena pada tahun ini krisis dipicu oleh perbankan yang tidak memperhatikan hal ini. Gejolak internal maupun eksternal harus diperkuat secara fundamental karena semakin kompleksnya risiko perbankan dan menimbulkan peluang-peluang baru dalam hal risiko. Praktek tata kelola yang sehat (*good corporate governance*) sangat dibutuhkan karena semakin kompleksnya risiko perbankan sehingga fungsi identifikasi, pengukuran, pemantauan dan pengendalian risiko bank sangat diperlukan. Risiko utama dalam hal perbankan ada 3 jenis yaitu risiko kredit, risiko pasar, risiko operasional. Teknik pengukuran risiko yang sedang berkembang pada saat ini adalah metode *Value at Risk* (VaR). VaR adalah pengukuran risiko secara kuantitatif yang mengestimasi potensi kerugian maksimal (*maximum potential loss*) yang terjadi di masa datang dan dihadapi pada jangka waktu tertentu (*holding period*) dan pada tingkat kepercayaan (*confidence level*) tertentu. Dalam menghitung VaR ini ada tiga pendekatan yang bisa digunakan yaitu *Parametric VaR*, *Monte Carlo*, dan *Historical Simulation*. Penelitian ini metode yang digunakan adalah *Parametric VaR* dengan menggunakan pendekatan volatilitas menggunakan EWMA dan GARCH. Kerugian maksimum yang mungkin diderita suatu bank diestimasi dengan menggunakan volatilitas atau suatu ukuran untuk mengetahui fluktuasi harga suatu aset. Asumsi *level of confidence* metode *Exponentially Weighted Moving Average* (EWMA) dalam hal mengestimasi volatilitas pada PT Bank ABC ini adalah 99% dengan *decay factor* 0,94. Untuk menentukan ketepatan metode dan asumsi yang digunakan oleh Bank X agak sulit mengingat terdapat berbagai metode yang digunakan untuk melakukan estimasi volatilitas.

Kata kunci:
Resiko pasar, *EWMA*, *GARCH* dan *internal model*

ABSTRACT

Name : Sandi Januar Pribadi
Study Program: Magister Manajemen
Title : Measurement of VaR Foreign Exchange Portfolio
GARCH and EWMA Volatility Estimation in PT Bank ABC

Risk and return management are main priority in banking. Crisis that happens in 1997 was one of the worst examples of managing risk and return in Indonesian banking. Since at that time there were no attention given to risk and return management. Internal and external shock must be strengthened fundamentally due to complexity risk of banking and given opportunity in term of risk. Good corporate governance is needed because higher risk will affect on identification, measure, supervision and control function of a bank. There are 3 main risk on banking: credit risk, market risk and operational risk. Risk measuring technique that very common at present is Value at Risk (VaR) method. VaR is risk quantitative measurement which estimate maximum potential loss that could occur in the future or in holding period and apply on certain confidence level. There are 3 approaches to measure VaR. They are Parametric VaR, Monte Carlo and Historical Simulation. This research based on Parametric VaR with EWMA and GARCH approaches. Maximum loss that might be happened to one bank could be estimate by using volatility or measuring price fluctuation on an asset. Level of confidence assumption on exponentially Weighted Moving Average (EWMA) method to estimate the volatility on Bank ABC is 99% with 0.94 decay factor. To make sure the precise method and assumption on Bank ABC is hard since there are many methods used to estimate the volatility.

Key word:

Market risk, *EWMA*, *GARCH* and *internal model*

BAB I

PENDAHULUAN

1.1. Latar Belakang

Dunia perbankan baik di dunia maupun di Indonesia selalu dikelilingi oleh risiko yang menghantamnya dari seluruh penjuru. Arus reformasi dalam segala bidang kehidupan dan globalisasi dalam bidang perekonomian telah menyebabkan perbankan terkeping risiko dari berbagai penjuru mata angin. Tidak ada jalan lain bagi perbankan agar dapat lolos dari kepingan risiko itu selain melakukan strategi penerapan manajemen yang andal dalam mengendalikan risiko yang dihadapinya itu sendiri.

Krisis yang terjadi pada tahun 1997 merupakan contoh yang paling konkrit yang menggambarkan kondisi terburuk perbankan Indonesia karena pada tahun ini krisis dipicu oleh kondisi perbankan yang tidak memperhatikan prinsip kehati-hatian. Menjadi tugas pemerintah yang harus menyelesaikan permasalahan ini yang salah satu langkah ekstrimnya dengan melikuidasi puluhan bank dengan beberapa tahapan sementara langkah yang lain dengan mencoba menyelamatkan bank dengan cara rekapitalisasi. Kedua langkah ini tidak saja mengeluarkan biaya yang sangat banyak tetapi juga menguras dana yang seharusnya bisa digunakan untuk pembangunan agar kecukupan modal bagi bank yang direkapitalisasi dapat mencukupi.

Basel I Accord melalui *market risk amendment 1996* telah meliputi *traded market risk* disamping *credit risk*. Dalam *Basel II Accord*, liputan atas risiko-risiko yang mempengaruhi kecukupan modal tersebut telah diperluas sehingga meliputi pula berbagai jenis risiko lainnya. Bank Indonesia sebagai Bank Sentral sekaligus menjadi *regulator* di Indonesia memberikan perhatian serius untuk membenahi sistem perbankan nasional dengan memberlakukan peraturan yang dikemukakan dalam *Basel Amendment* yang dikeluarkan oleh *Bank for International Settlement (BIS)*.

Melalui Peraturan Bank Indonesia Nomor: 5/12/PBI/2003 tanggal 17 Juli 2003 tentang Kewajiban Penyediaan Modal Minimum atau KPMM, Bank wajib memenuhi kriteria yaitu:

- a. Bank dengan total aktiva sebesar Rp. 10.000.000.000.000,00 (sepuluh triliun rupiah) atau lebih;
- b. Bank devisa dengan posisi surat berharga dan atau posisi transaksi derivatif dalam *Trading Book* sebesar Rp. 20.000.000.000,00 (dua puluh milyar rupiah) atau lebih;
- c. Bank bukan bank devisa dengan posisi surat berharga dan atau posisi transaksi derivatif suku bunga dalam *Trading Book* sebesar Rp. 25.000.000.000,00 (dua puluh milyar rupiah) atau lebih.

Selain risiko operasional dan risiko kredit, salah satu risiko yang mengancam yang dihadapi perbankan adalah risiko pasar. Risiko pasar adalah risiko kerugian pada posisi portfolio *trading* pada *on* dan *off balance sheet*. Kerugian ini muncul sebagai akibat dari terjadinya perubahan harga pasar *asset* dan *liabilities* bank tersebut. Perubahan harga tersebut merupakan akibat terdapatnya perubahan faktor pasar. Salah satu faktor pasar yang akan dibahas disini adalah nilai tukar mata uang asing.

Risiko nilai tukar (*foreign exchange risk*) merupakan salah satu bagian dari risiko pasar sehingga mulai tahun 2005 salah satunya adalah nilai tukar harus dihitung dan dimasukkan dalam perhitungan *Capital Adequacy Ratio* atau *CAR* dan harus memenuhi kriteria tersebut.

Dua metodologi untuk mengukur potensi kerugian atas perubahan nilai instrumen keuangan yang diakibatkan oleh perubahan nilai tukar, yaitu Gap Analisis dan VaR. Dalam Gap Analisis risiko *forex* dihitung untuk setiap mata uang asing dimana bank mempunyai posisi dengan cara menghitung *exposure* dan volatilitas baik pada valas tunggal maupun gabungan. Sementara dalam VaR digunakan untuk menghitung perubahan nilai instrumen keuangan bank akibat perubahan nilai tukar untuk setiap mata uang asing.

Pengukuran yang direkomendasikan oleh BIS ini adalah internal model dengan menggunakan *Value at Risk* (VaR). Metode VaR salah satu model yang banyak digunakan dalam perbankan di dunia maupun di Indonesia untuk mengukur risiko pasar. Perhitungan VaR yang akan dilakukan adalah dengan menggunakan *Exponentially Weighted Moving Average* (EWMA) dengan menggunakan asumsi *level of confidence* 99% dan *decay factor* 0,94 dan *Generalized Autoregressive Conditional Heteroskedasticity* (GARCH). Yang masih harus dipertanyakan disini adalah tentang penggunaan metode dan asumsi yang

digunakan oleh PT Bank ABC apakah sudah tepat karena terdapat berbagai metode yang digunakan untuk melakukan estimasi volatilitas.

1.2. Perumusan Masalah

Berdasarkan latar belakang diatas, penelitian ini akan difokuskan pada permasalahan sebagai berikut :

1. Bagaimana karakteristik data *return* nilai tukar mata uang USD, EUR, JPY dan GBP terhadap IDR selama periode penelitian 12 Januari 2008 sampai dengan 31 Desember 2007
2. Berapa besarnya hasil perhitungan VaR untuk nilai mata uang USD, EUR, JPY dan GBP terhadap IDR dengan menggunakan estimasi volatilitas *Generalized Autoregressive Conditional Heteroskedasticity* (GARCH)
3. Berapa besarnya hasil perhitungan VaR untuk nilai mata uang USD, EUR, JPY dan GBP terhadap IDR dengan menggunakan estimasi volatilitas *Exponentially Weighted Moving Average* (EWMA)
4. Berapa besarnya hasil perhitungan VaR portofolio menggunakan model estimasi volatilitas terbaik

1.3. Tujuan Penelitian

Berdasarkan informasi diatas, tujuan yang ingin dicapai melalui penelitian ini adalah

1. Mengetahui karakteristik data *return* nilai tukar mata uang USD, EUR, JPY dan GBP terhadap IDR selama periode penelitian 12 Januari 2008 sampai dengan 31 Desember 2007
2. Memberikan informasi besarnya hasil perhitungan VaR untuk nilai mata uang USD, EUR, JPY dan GBP terhadap IDR dengan menggunakan estimasi volatilitas *Generalized Autoregressive Conditional Heteroskedasticity* (GARCH)
3. Memberikan informasi besarnya hasil perhitungan VaR untuk nilai mata uang USD, EUR, JPY dan GBP terhadap IDR dengan menggunakan estimasi volatilitas *Exponentially Weighted Moving Average* (EWMA)
4. Memberikan informasi besarnya hasil perhitungan VaR portofolio menggunakan model estimasi volatilitas terbaik

1.4. Metode Penelitian

Penelitian dilakukan dengan melakukan pengumpulan data melalui elektronik yaitu *internet* dan juga studi pustaka. Data tersebut diambil dari www.bi.go.id dimana dalam *web site* tersebut tersedia dalam mata uang asing lebih dari 5.000 hari. Beberapa kajian teori yang dikemukakan berdasarkan berbagai literatur yaitu buku dan jurnal yang berhubungan dengan penelitian ini.

Selanjutnya melakukan pengujian data dengan menghitung *return* masing-masing nilai tukar dengan menggunakan formula logaritma normal. Selanjutnya data *return* tersebut diuji dengan pendekatan statistik dengan tahapan

1. Studi literatur mengenai VaR.
2. Pengumpulan data kurs
3. Perhitungan *return* masing-masing nilai tukar dengan pendekatan logaritma normal
4. Pengujian data *return* masing-masing nilai tukar. Pengujian yang dilakukan adalah:
 - Uji stasioneritas dengan ADF test
 - Uji normalitas dengan *Jarque-Bera test*
 - Pengujian *heteroskedasticity* dengan *White test*
 - Menguji data *return* untuk menentukan volatilitas yang akan digunakan
5. Menghitung VaR

1.5. Sistematika Penulisan

Secara garis besar sistematika penulisan karya akhir ini mempunyai tahapan sebagai berikut:

Bab I Pendahuluan

Dalam bab ini menjelaskan tentang latar belakang penulisan, perumusan masalah, tujuan penelitian, metode penelitian dan teknik pengumpulan data, serta sistematika penulisan.

Bab II Landasan Teori

Bab ini menjelaskan tentang teori yang mendasari pembahasan masalah melalui studi pustaka yang meliputi penjelasan teori mengenai:

- Definisi VaR serta teori-teori matematika dan statistik yang menjadi dasar perhitungan VaR
- Metode perhitungan VaR dengan pendekatan EWMA dan GARCH

Bab III Data dan Metodologi Penelitian

Bab ini menjelaskan bagaimana cara penerapan asumsi, pemilihan model dan penggunaan data yang diperlukan untuk perhitungan VaR.

Bab IV Analisis Pembahasan

Pada bab ini perhitungan VaR dimulai dengan menggunakan model EWMA dan GARCH.

Bab V Kesimpulan dan Saran

Bab ini menjelaskan kesimpulan atas hasil dari penelitian dan juga saran-saran untuk memberikan arti yang lebih dalam pengembangan penelitian selanjutnya.

BAB II

LANDASAN TEORI

Dalam Bab ini akan diuraikan teori nilai tukar, teori risiko, risiko pasar, risiko nilai tukar, metode pengukuran risiko pasar, konsep, pengertian dan metode pengukuran *VaR*, konsep estimasi volatilitas EWMA dan GARCH.

2.1. Teori Nilai Tukar

Pengertian valuta asing menurut Bank Indonesia adalah mata uang asing yang digunakan dalam perdagangan internasional. Valuta asing atau valas diartikan sebagai seluruh kewajiban terhadap mata uang asing yang dapat dibayar diluar negeri, baik berupa simpanan pada bank di luar negeri maupun kewajiban dalam mata uang asing (Berlianta, hal.1, 2004).

Posisi pada transaksi valas dapat diartikan sebagai selisih antara tagihan dan aset dengan kewajiban suatu mata uang tertentu. Posisi valas dapat dibagi menjadi dua yaitu :

1. Posisi *long*

Posisi *long* adalah suatu posisi dimana total tagihan dan aset suatu mata uang tertentu lebih besar dari total kewajibannya.

2. Posisi *short*

Posisi *short* adalah suatu posisi dimana total tagihan dan aset suatu mata uang tertentu lebih kecil dari total kewajibannya.

2.2. Risiko dan Risiko Pasar (*Market Risk*)

2.2.1. Pengertian Risiko

Menurut Jorion (hal. 3, 2001) menyebutkan bahwa risiko adalah volatilitas dari suatu kejadian yang tidak diharapkan (*unexpected outcomes*) yang akan berpengaruh terhadap nilai dari aset dan kewajiban suatu bank.

Risiko dalam teori portofolio didefinisikan sebagai standar deviasi atau volatilitas tingkat imbal hasil (*return*). Standar deviasi menunjukkan seberapa jauh besarnya penyimpangan dari nilai yang diperoleh dengan nilai yang diharapkan. Semakin besar nilai

standar deviasi, semakin besar kemungkinan nilai aktual menyimpang dari yang diharapkan.

Bank Indonesia (PBI No. 5/8/PBI/2003, pasal 1, butir 2) mendefinisikan risiko sebagai potensi terjadinya suatu peristiwa (*events*) yang dapat menimbulkan kerugian bank.

2.2.2. Pengertian Risiko Pasar

Menurut Crouhy, Galai dan Mark (hal.34, 2001), risiko pasar adalah risiko dimana perubahan harga-harga pasar keuangan dan tingkat bunga akan dapat menurunkan nilai posisi bank. Dalam suatu aktifitas perdagangan, risiko bisa disebabkan karena adanya *open (unhedged) positions* dan korelasi yang tidak sempurna antara *market positions* yang direncanakan akan saling di-*offset*.

The Bank for International Settlement (BIS) dalam *Amendment to the Capital Accord to Incorporate Market Risks* (hal 1, 1996), risiko pasar didefinisikan sebagai “*the risk of losses in on-and off-balance-sheet positions arising from movements in market prices*”.

Sesuai dengan *Amendment* 1996, jenis risiko pasar yang diperhitungkan adalah sebagai berikut:

- Risiko perubahan harga pasar dari instrumen keuangan (misalnya: *bonds, swap, future, options*, dsb) atau *equities* yang sensitif terhadap perubahan suku bunga yang terdapat pada *trading bank*,
- Risiko perubahan suku bunga (*interest rate risk*) dari instrumen-instrumen keuangan *non-derivatif*,
- Risiko perubahan nilai tukar (*foreign exchange risk*) dan risiko memegang posisi dalam komoditi (produk pertanian, *mineral non-oil* dan logam mulia *non-gold*) pada seluruh kegiatan usaha bank, *trading book* maupun *banking book*.

2.2.3. Risiko Nilai tukar (*Foreign Exchange Risk*)

Risiko nilai tukar adalah risiko kerugian akibat perubahan nilai tukar mata uang termasuk perubahan harga emas dari posisi bank dalam *trading* dan *banking book* (Bank Indonesia, hal. 32, 2003). Penyebab utama risiko nilai tukar adalah adanya ketidaksempurnaan korelasi antara pergerakan nilai tukar dan fluktuasi tingkat suku bunga internasional

(Crouhy, Galai, Mark, hal. 179, 2001). Risiko ini timbul karena kebijakan posisi terbuka atau posisi *hedging* yang tidak sempurna.

Risiko nilai tukar adalah merupakan salah satu jenis dari risiko pasar. Risiko nilai tukar ini dapat timbul karena lemahnya nilai suatu mata uang suatu negara terhadap mata uang asing. Setiap fluktuasi nilai tukar yang terjadi di pasar akan membawa dampak finansial langsung terhadap pendapatan dan biaya bank.

Sesuai dengan ketentuan Bank Indonesia perihal : Pedoman Perhitungan Kewajiban Penyediaan Modal Minimum Bank Umum Dengan Memperhitungkan Risiko pasar (*Market Risk*) dan Pedoman Perhitungan Posisi Devisa Neto Bank Umum, perhitungan risiko nilai tukar didasarkan pada Posisi Devisa Neto (PDN) yang dimiliki Bank.

Menurut Antl (hal.5, 1999), "*Forex exposure arises when a corporation has transactions denominated in currencies other than its own or when it has net assets or liabilities outside the home country. As forex change, the value of the transactions or the value of the net assets and liabilities abroad changes when translated into the parents currencies*".

2.3. Metode Pengukuran Risiko Pasar

2.3.1. Konsep Value at Risk (VaR)

Pada tahun 1996, *Basle Committee on Banking Supervision* menyarankan agar perbankan menerapkan metode VaR dalam menghitung risiko pasar. VaR adalah suatu metode pengukuran risiko yang menggunakan teknik standar statistik. Menurut Jorion (hal 22, 2002), "*VaR summarizes the worst loss over a target horizon with a given level of confidence*". Menurut Best (hal. 10, 1998), "*Value at risk is the maximum amount of monye that may be lost on a portofolio over a given period of time, with a given level of confidence*".

2.3.2. Pengertian VaR

Menurut Philip (1998 : 10), definisi *VaR* secara umum adalah jumlah maksimal uang yang mungkin hilang dalam periode tertentu dan pada tingkat kepercayaan tertentu. Apabila *VaR* dihitung untuk periode 1 hari (*holding period* 1 hari) dengan tingkat kepercayaan 99%, maka definisi *VaR* adalah jumlah maksimum uang yang mungkin hilang pada

portolio dalam 1 hari dengan tingkat kepercayaan 99%. Dengan kata lain, kemungkinan terjadi kerugian yang melebihi *VaR* dalam waktu 1 hari hanya sebesar 1% (1 dari 100 kemungkinan).

Hendricks (1995) menyatakan bahwa *VaR* mengukur risiko pasar dengan menentukan besar penurunan nilai portfolio selama periode waktu tertentu dengan probabilitas tertentu akibat perubahan harga pasar. Misalnya periode yang dipilih 1 hari dan tingkat kepercayaan 95%, maka ukuran *VaR* merupakan estimasi penurunan nilai pasar yang dapat terjadi dengan probabilitas 95% sampai dengan hari berikutnya. Dengan kata lain, jika diperoleh *VaR* yang akurat, maka kerugian atau penurunan nilai portfolio lebih besar atau sama dari ukuran tersebut terjadi dengan keyakinan 95%.

2.3.2.1. Parametric VaR

Parametric *VaR* disebut juga *Linear VaR*, *Variance-Covariance*, *Greek-Normal VaR*, *Delta Normal VaR*, atau *Delta-Gamma Normal VaR*. Pendekatan ini mengasumsikan bahwa distribusi probabilitas *return* adalah normal dan memerlukan perhitungan *parameter variance* dan *covariance*. Apabila aset finansial hanya dipengaruhi oleh satu faktor saja, maka parameter yang digunakan hanya *variance* saja. Sedangkan bila aset finansial berbentuk portofolio yang dipengaruhi beberapa faktor pasar, maka harus menghitung *covariance*.

2.3.2.1.1. Data Return

Dalam pengukuran risiko pasar, tingkat *return* aset finansial merupakan *random variable* (Jorion, hal 99, 2000). Ada dua metode untuk pengukuran *return* :

1. *The arithmetic atau discrete*

Pada metode ini *rate of return* merupakan penjumlahan dari *capital gain* dan pembayaran dividen atau kupon dimana mempunyai persamaan sebagai berikut:

$$r_t = \frac{P_t + D_t - P_{t-1}}{P_{t-1}} \quad (2.1)$$

2. Geometric rate of return

Pada metode ini *rate of return* merupakan logaritma dari rasio harga, yaitu:

$$r_t = \ln \frac{P_t + D_t}{P_{t-1}} \quad (2.2)$$

Dalam penyederhanaan rumus maka untuk pembayaran dividen diasumsikan nol ($D_t = 0$) sehingga persamaan (2.2) diatas menjadi :

$$r_t = \ln \frac{P_t}{P_{t-1}} \quad (2.3)$$

Dimana:

R_t = *rate of return* pada hari t

P_t = harga kurs/aset pada saat t

P_{t-1} = harga kurs/aset pada saat t-1

2.3.3. VaR Single Instrument

VaR untuk aset tunggal menurut Jorion (hal. 14, 1998) dihitung dengan menggunakan persamaan sebagai berikut:

$$VaR = \alpha \times \sigma \times P \quad (2.4)$$

Dimana :

α = *Confidence of Level* (Derajat Kepercayaan)

σ = *Estimate of Volatility* (Estimasi Volatilitas)

P = Nilai posisi aset

Ketika *holding period* diperhitungkan dalam persamaan (2.4) maka rumus *VaR* akan menjadi:

$$VaR = \alpha \times \sigma \times P \times \sqrt{t} \quad (2.5)$$

Dimana :

t = *holding period*

2.3.3.1. Confidence Level

Confidence level merupakan suatu nilai tertentu yang tidak akan dilampaui dengan *probability* yang telah ditentukan (Marrison, hal 24, 2002). Contoh, hanya ada 5%

kemungkinan suatu variabel yang diambil dari *Standard Normal Distribution* nilainya akan $> 1,64$. Bisa dikatakan bahwa tingkat kepercayaan untuk 95% variabel ini adalah 1,64.

2.3.3.2. Estimate of Volatility

Volatilitas *return* ditunjukkan dengan varian atau standar deviasi *return*. Volatilitas adalah pengukuran statistik variasi harga suatu instrumen (Butler, hal.190, 1999). Dalam melakukan *forecasting*, volatilitas umumnya diasumsikan konstan dari waktu ke waktu, walaupun kenyataannya tidak. Menurut Watsham (hal.191,1997), volatilitas yang konstan dari waktu ke waktu disebut *homoskedastic*, sedangkan volatilitas yang tidak konstan disebut *heteroskedastic*.

2.3.3.3. Holding Period

Dalam VaR mengukur risiko pasar dengan menentukan besar penurunan nilai portofolio selama periode waktu tertentu dengan probabilitas tertentu akibat perubahan harga pasar. Periode yang dipilih 1 hari dan tingkat kepercayaan 95%, maka ukuran VaR merupakan estimasi penurunan nilai pasar yang dapat terjadi dengan probabilitas 95% sampai dengan hari berikutnya. Maka, Jika diperoleh VaR yang akurat, maka kerugian penurunan dari nilai portofolio lebih rendah atau sama dari ukuran tersebut terjadi dengan keyakinan 95% (Hendricks, 1995)

Jorion (2001) menyatakan bahwa *holding period* adalah jangka waktu ke depan dalam satuan hari *VaR* dihitung. Pemilihan *holding period* apakah satu bulan atau satu hari sangat subyektif dan tergantung pada bisnis bank atau institusi keuangan dan juga tergantung pada jenis portofolio yang akan dianalisa. Idealnya, *holding period* dihubungkan dengan periode terpanjang yang diperlukan untuk melikuidasi portofolio tertentu (Jorion, hal.24, 2001)

Penentuan *holding period* tergantung pada bagaimana dan apa yang akan direpresentasikan dalam penggunaan VaR. *Holding period* sebesar satu hari merupakan basis perhitungan VaR, karena berapapun *holding period*-nya, VaR akan dikalikan dengan VaR pada posisi *holding period* satu hari. VaR adalah potensi kerugian pada portofolio pada 1 hari mendatang dengan mengasumsikan ukuran dan komposisi dari portofolio tetap konstan.

2.3.4. Pengukuran Volatilitas

Pengukuran volatilitas yang digunakan adalah

1. Volatilitas Konstan (*Constant Volatility*) : Standar Deviasi (*Standard Deviation*), Rata-rata Bergerak Sederhana (*Simple Moving Average*), *Historical Simulation*
2. Volatilitas Tidak Konstan (*Non-Constant Volatility*) : *Generalized Autoregressive Conditional Heteroskedastic* (GARCH)

2.3.4.1. Volatilitas Konstan

Untuk mendapatkan nilai *VaR* dari setiap metode, dibutuhkan pengukuran volatilitas yang berpengaruh langsung terhadap nilai *VaR* yang dihasilkan. Volatilitas yang umumnya digunakan adalah:

2.3.4.1.1. Model Estimasi Volatilitas *Standard Deviation*

Standar deviasi digunakan untuk menghitung volatilitas data yang memiliki distribusi normal. Standar deviasi mengukur penyebaran distribusi yang merupakan jarak rata-rata perubahan harga terhadap mean sebagai puncak. Asumsi metode ini adalah merupakan estimasi nilai konstan dari volatilitas (Steel, 1991, 28)

$$\sigma^2 = \frac{\sum_{j=1}^i (x_i - \mu)^2}{n} \quad (2.6)$$

dimana

σ^2 : varian portfolio

x_i : variabel ke i

μ : *mean*

n : jumlah variabel

Nilai n digunakan sebagai bobot dari dalam memperhitungkan varian dari populasi, untuk perhitungan pada sampel data yang digunakan adalah $n-1$. Penggunaan $n-1$ dalam perhitungan ini karena adanya kenyataan bahwa varian diperkirakan berada sekitar parameter yang tidak diketahui yaitu nilai rata-rata atau μ , oleh sebab itu diperlukan *adjustment* terhadap nilai varian dari sampel tersebut, akan tetapi dalam banyak situasi nilai n besar sehingga *adjustment* tidak banyak berarti.

2.3.4.2. Volatilitas Tidak Konstan

Asumsi volatilitas dan korelasi biasanya konstan, tetapi kenyataannya volatilitas dan korelasi pada data keuangan adalah tidak konstan, kadang menunjukkan ketidakteraturan. Bisa saja pada suatu periode volatilitasnya rendah namun berikutnya diikuti dengan volatilitas tinggi. Hal ini disebut dengan *volatility clustering*.

2.3.4.2.1. *Generalized Autoregressive Conditional Heteroskedasticity (GARCH)*

ARCH = *Auto Regressive Conditional Heteroscedasticity*, GARCH = *Generalized Auto Regressive Conditional Heteroscedasticity*. ARCH – GARCH model telah digunakan secara luas dalam analisa *time series*, tapi penerapan dalam *finance* telah secara sukses menjadi fokus dari pengenalan model ini. Keputusan Financial telah umum menjadi pertukaran antara resiko dan *return*. Analisa ekonomi dari suatu resiko telah menjadi keseluruhan dari *asset pricing*, optimalisasi dari portfolio, *options pricing*, dan manajemen resiko.

Model ARCH diperkenalkan oleh Engle (1982), sedangkan model GARCH yang merupakan model generalisasi ARCH diperkenalkan oleh Bollerslev (1986). Model ini dirancang untuk membuat suatu model dan melakukan peramalan terhadap *time series* waktu yang mengandung *conditional variance*. Varian dari variabel tidak bebas dibentuk dengan menggunakan nilai dari variabel tidak bebas dan variabel bebas periode sebelumnya.

Pada data runtun waktu keuangan, keberadaan ARCH atau suatu bentuk autoregresi dari kuadrat residual biasanya ditandai dengan adanya *fat tail (excess curtosis)* atau *volatility clustering*. *Fat tail* ditandai dengan distribusi probabilitas return yang menunjukkan tail yang lebih gemuk dibandingkan distribusi normal.

Model ini mengasumsikan bahwa *return* dihasilkan oleh proses *stochastic* dengan *time-varying volatility*, *variance* dari *return* akan mengikuti proses yang dapat diprediksi. Model GARCH mempersyaratkan kondisi *heteroskedastic* dalam suatu perubahan *variance*.

Proses ARCH (p) menangkap *conditional heteroskedasticity* dari *financial return* dengan mengasumsikan bahwa *conditional variance* hari ini merupakan rata-rata tertimbang dari *past squared unexpected return*:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \dots + \alpha_p \varepsilon_{t-p}^2 \quad (2.7)$$

dimana:

$$\alpha_0 > 0, \alpha_1, \dots, \alpha_p \geq 0$$

$$\alpha_1 = \text{slope}$$

$$\varepsilon_t = \text{residual pada waktu } t$$

Model ARCH jarang digunakan pada pasar financial karena dengan menggunakan GARCH sederhana *performance* model sangat baik. Model GARCH (p,q) menambahkan q *autoregressive terms* di spesifikasi ARCH (p) sehingga persamaan *conditional variance* menjadi:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \dots + \alpha_p \varepsilon_{t-p}^2 + \beta_1 \sigma_{t-1}^2 + \dots + \beta_q \sigma_{t-q}^2 \quad (2.8)$$

dimana:

$$\alpha_0 > 0, \alpha_1, \dots, \alpha_p, \beta_1, \dots, \beta_q \geq 0$$

$$\alpha_p = \text{error coefficient pada waktu ke-p}$$

$$\varepsilon_t = \text{residual}$$

$$\beta_q = \text{lag coefficient}$$

Model *Generic* GARCH memiliki hipotesis bahwa estimator volatilitas bergantung pada nilai *lag* kuadrat *return* dan *lag* estimasi volatilitas (Dowd, hal 93, 1999):

$$\sigma_t^2 = \alpha_0 + \sum_{i=0}^p \alpha_i r_{t-1}^2 + \sum_{i=1}^q \beta_i \sigma_{t-1}^2 \quad (2.9)$$

dengan asumsi semua parameter adalah positif. Estimator GARCH (1,1) diperoleh bila p = q = 1 dan model ini sering disebut dengan *generic* atau *vanilla* model GARCH:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \beta_1 \sigma_{t-1}^2 \quad (2.10)$$

dimana:

$$\sigma_t^2 = \text{forecast varian pada saat } t$$

$$\varepsilon_{t-1}^2 = \text{residual saat } t-1$$

$$\alpha_0 = \text{konstanta } > 0, \alpha, \beta \geq 0$$

Nilai α dan β menunjukkan *short-run dynamic* dari hasil *time series* volatilitas. Semakin tinggi β menunjukkan bahwa *shock* pada *variance* akan membutuhkan waktu lama untuk kembali. Semakin tinggi α menunjukkan bahwa reaksi volatilitas sangat intensif terhadap pergerakan pasar. Apabila nilai α tinggi dan β rendah maka volatilitas cenderung *spiky* (Alexander, hal 73, 2001).

2.3.4.2.2. *Exponential Weighted Moving Average (EWMA)*

EWMA adalah pendekatan *forecasting* volatilitas dengan melakukan estimasi volatilitas di masa datang dimana data observasi terkini diberikan bobot yang lebih besar dibandingkan dengan data lampau. Pembobotan ini didasari asumsi bahwa data terkini memberikan informasi kondisi pasar yang lebih baik dibandingkan dengan data masa lampau (Marrison, hal.134,2002)

Forecast volatilitas merupakan rata-rata tertimbang dari *forecast* volatilitas periode sebelumnya dan kuadrat *return* saat ini. Morgan (1996) mempunyai persamaan pendekatan EWMA adalah sebagai berikut:

$$\sigma_t^2 = \lambda \sigma_{t-1}^2 + (1-\lambda)r_t^2 \quad (2.11)$$

dimana:

σ_t^2 = varian dari *return* pada waktu t

r_t = *return* pada waktu t

λ = parameter *decay factor*

Untuk menghitung *forecast* volatilitas dilakukan dengan mengakarkan persamaan (2.11) sehingga menjadi:

$$\sigma_t = \sqrt{\lambda \sigma_{t-1}^2 + (1-\lambda)r_t^2} \quad (2.12)$$

dimana:

σ_t = *forecast volatility* pada hari t

Dua persamaan (2.12) di atas, yaitu $\lambda \sigma_{t-1}^2$ yang menunjukkan *persistence* dari volatilitas, bila volatility hari kemarin tinggi maka hari ini juga tetap tinggi. Bagian yang kedua $(1-\lambda)r_t^2$ menunjukkan intensitas reaksi volatilitas terhadap kondisi pasar. Semakin kecil λ maka semakin reaktif volatilitas terhadap informasi pasar mengenai *return* kemarin.

Parameter λ (*decay factor*) menunjukkan skala bobot dari pengamatan data terbaru dengan data sebelumnya dengan nilai $0 < \lambda < 1$. Semakin tinggi λ akan semakin besar bobot yang dikenakan pada data lampau sehingga data series semakin *smooth*. Bila λ mendekati 1, maka volatilitas akan semakin *persistence* mengikuti *market shock* (Alexander, hal.58, 2001)

Nilai λ ditentukan dengan *Root Mean Squared Error (RMSE)*, dimana λ ditentukan sedemikian sehingga *error* antara nilai variabel random dengan volatilitasnya

pada saat yang sama mempunyai nilai terkecil. Menurut Morgan (hal.98, 1996), *decay factor optimum* ditentukan dengan persamaan:

$$\text{RMSE} = \sqrt{\frac{1}{T} \sum_{t=1}^T (R_{t+1}^2 - \sigma_{t+1|t}^2(\lambda))^2} \quad (2.13)$$

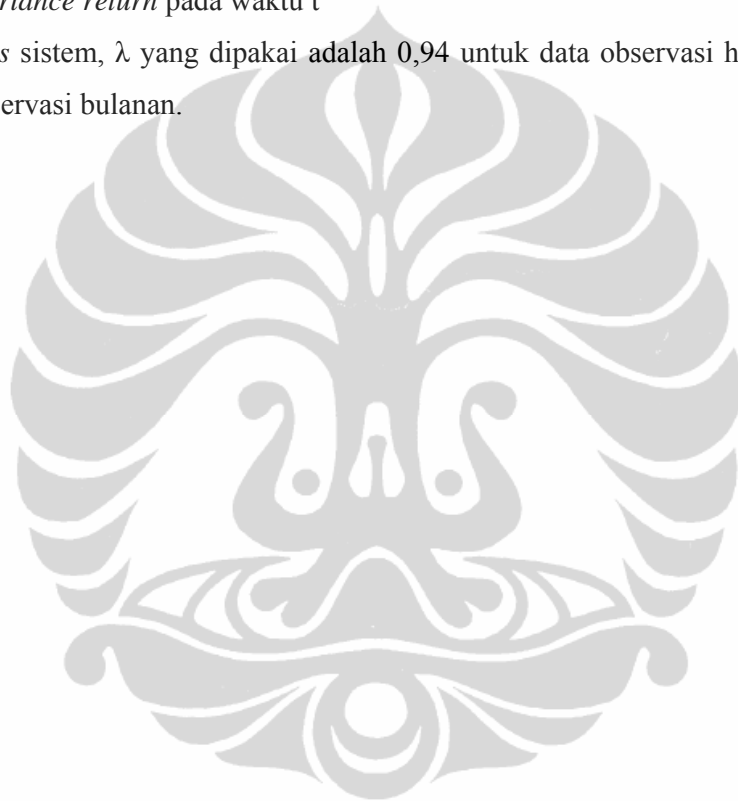

dimana:

$$\sigma_{t+1|t}^2 = (\lambda \times F(t/(t-1))) + (1-\lambda) \times X_t$$

$$F(t/(t-1)) = \text{forecast variance } t-1$$

$$X_t = \text{variance return pada waktu } t$$

Dalam *Risk Metrics* sistem, λ yang dipakai adalah 0,94 untuk data observasi harian, dan 0,97 untuk data observasi bulanan.

BAB III

DATA DAN METODOLOGI PENELITIAN

Bab ini menguraikan tentang gambaran perusahaan secara umum, visi, misi dan strategi bisnis perusahaan, kinerja umum perusahaan, strategi manajemen risiko, strategi manajemen risiko nilai tukar, dan metode penelitian

3.1. Gambaran Umum Perusahaan

PT Bank ABC berdiri pada tanggal 16 Desember 1895 dan merupakan salah satu bank tertua di Indonesia. PT Bank ABC ini didasarkan pelayanan pada masyarakat kecil sampai sekarang tetap konsisten, yaitu dengan fokus pemberian fasilitas kredit kepada golongan pengusaha kecil. Hal ini tercermin pada perkembangan penyaluran KUK pada tahun 1994 sebesar Rp. 6.419,8 milyar yang meningkat menjadi Rp. 8.231,1 milyar pada tahun 1995 dan pada tahun 1999 sampai dengan bulan September sebesar Rp. 20.466 milyar.

Dengan perkembangan dunia perbankan yang semakin pesat maka sampai saat ini PT Bank ABC mempunyai Unit Kerja yang berjumlah 4.447 buah, yang terdiri dari 1 Kantor Pusat, 12 Kantor Wilayah, 12 Kantor Inspeksi/SPI, 170 Kantor Cabang (Dalam Negeri), 145 Kantor Cabang Pembantu, 1 Kantor Cabang Khusus, 1 New York Agency, 1 Caymand Island Agency, 1 Kantor Perwakilan Hongkong, 40 Kantor Kas Bayar, 6 Kantor Mobil Bank, 193 *Payment Point*, 3.705 BANK ABC Unit dan 357 Pos Pelayanan Desa.

3.1.1. Visi dan Misi PT Bank ABC

Visi PT Bank ABC adalah menjadi bank komersial terkemuka yang selalu mengutamakan kepuasan nasabah. Misi PT Bank ABC adalah sebagai berikut :

- Melakukan kegiatan perbankan yang terbaik dengan mengutamakan pelayanan kepada usaha mikro, kecil dan menengah untuk menunjang peningkatan ekonomi masyarakat.
- Memberikan pelayanan prima kepada nasabah melalui jaringan kerja yang tersebar luas dan didukung oleh sumber daya manusia yang profesional dengan melaksanakan praktek *good corporate governance*.
- Memberikan keuntungan dan manfaat yang optimal kepada pihak-pihak yang berkepentingan.

3.1.2. Manajemen Risiko

Kegiatan usaha PT Bank ABC senantiasa dihadapkan pada risiko-risiko yang berkaitan erat dengan fungsinya sebagai lembaga intermediasi, sehingga operasional PT Bank ABC harus dikelola secara memadai agar tidak menimbulkan kerugian yang melebihi kemampuan PT Bank ABC. Risiko-risiko tersebut meliputi risiko kredit, risiko pasar, risiko likuiditas, risiko operasional, risiko hukum, risiko kepatuhan, risiko strategi dan risiko reputasi.

3.1.2.1. Organisasi Manajemen Risiko

Dalam mengelola risiko, PT Bank ABC telah membangun sistem manajemen risiko terpadu dan menyeluruh. Penerapan sistem manajemen risiko terpadu merupakan salah satu komitmen Direksi PT Bank ABC untuk meminimalkan potensi kerugian yang dihadapi oleh PT Bank ABC.

Manajemen risiko memiliki peran penting dalam pengelolaan bank guna pencapaian tujuan perusahaan melalui 2 (dua) aspek, yaitu melindungi modal dan mengoptimalkan hubungan *risk* dan *return*.

Pengelolaan manajemen risiko PT Bank ABC sejalan dengan penerapan model tiga garis pertahanan (*three lines of defense*) yaitu:

1. Risk taking units (unit kerja operasional) sebagai garis pertahanan pertama, adalah pihak yang bertanggung jawab melaksanakan fungsi pengendalian intern dan menjaga kualitas *output* dan proses bisnis sesuai dengan kebijakan dan prosedur yang telah ditetapkan. Unit kerja operasional melakukan pengendalian secara langsung terhadap *inherent risk*, sehingga diharapkan dapat meminimalkan residual risk.
2. Unit kerja manajemen risiko sebagai garis pertahanan kedua adalah unit kerja yang bertanggung jawab mengendalikan risiko agar eksposur secara keseluruhan tidak melampaui kemampuan modal PT Bank ABC. Pengendalian risiko tersebut dilakukan antara lain dengan penetapan dan pemantauan limit risiko.
3. Satuan Kerja Audit Intern sebagai garis pertahanan ketiga bertanggung jawab untuk memastikan efektivitas penerapan sistem pengendalian intern pada unit-unit kerja baik unit kerja operasional maupun unit kerja manajemen risiko.

3.1.2.2. Kebijakan Umum Manajemen Risiko

Kebijakan Umum Manajemen Risiko (KUMR) adalah aturan tertinggi dalam implementasi manajemen risiko pada seluruh kegiatan PT Bank ABC, baik yang bersifat konvensional maupun yang berdasarkan atas prinsip-prinsip syariah. KUMR PT Bank ABC mengatur hal-hal yang terkait dengan organisasi manajemen risiko, proses manajemen risiko (identifikasi, pengukuran, pemantauan dan pengendalian), integrasi manajemen risiko, sistem informasi manajemen risiko, sistem pengendalian intern, pengelolaan risiko produk dan aktivitas baru dan rencana darurat (*contingency plan*). KUMR PT Bank ABC yang telah direvisi untuk merubah struktur organisasi unit kerja operasional yang semula hanya satu kelompok *risk taking unit* menjadi *core risk taking unit* dan *supporting risk taking unit*.

3.1.2.3. Strategi Manajemen Risiko

Untuk memastikan agar aktivitas pengendalian risiko bisnis PT Bank ABC telah dilakukan secara memadai dengan memperhatikan kepentingan dan tujuan bisnis PT Bank ABC sebagaimana yang telah ditetapkan dalam KUMR PT Bank ABC maka Direksi PT Bank ABC menetapkan strategi manajemen risiko. Strategi manajemen risiko PT Bank ABC meliputi:

- penetapan parameter dan limit risiko
- perencanaan dan penerapan langkah-langkah mitigasi (*actions plan*) yang dibutuhkan dengan hasil penilaian kondisi eksposur risiko (profil risiko) yang dimiliki PT Bank ABC pada satu periode.

Limit-limit risiko tersebut diatas ditetapkan dan dikaji ulang secara berkala untuk memastikan bahwa profil risiko yang ada mendukung proses pencapaian target kinerja PT Bank ABC dengan tetap memperhatikan tingkat toleransi risiko.

3.1.2.4. Profil Risiko

Penilaian risiko PT Bank ABC secara agregat melalui proses *self assessment* menghasilkan profil risiko. Profil risiko tersebut terdiri dari *inherent risk* (risiko yang melekat pada aktivitas bank sebelum dilakukan kontrol) dan *risk control system* (pengendalian terhadap risiko inheren) terhadap 8 (delapan) jenis risiko pada 7 (tujuh) aktivitas fungsional PT Bank ABC yaitu aktivitas fungsional perkreditan, *treasury*, *trade*

finance, pendanaan, operasional dan jasa, *IT System* dan support. Profil risiko PT Bank ABC secara keseluruhan selama tahun 2007 berada pada kategori rendah (*low*).

Untuk menurunkan *risk composite* pada profil risiko PT Bank ABC, PT Bank ABC terus menyempurnakan penerapan *framework*, *governance* dan beberapa perangkat manajemen risiko operasional. Disamping itu, PT Bank ABC selalu berupaya mengefektifkan pelaksanaan forum manajemen risiko dan fungsi manajemen risiko di tiap unit kerja serta pembentukan Group Manajemen Risiko di Kantor Wilayah.

3.1.2.5. Risk Management Committee

Dalam melakukan pengelolaan eksposur risiko bisnis PT Bank ABC dan dalam penetapan Sistem Manajemen Risiko PT Bank ABC, Direksi PT Bank ABC dibantu oleh Risk Management Committee (RMC) BANK ABC sebagai badan tertinggi dalam sistem manajemen risiko PT Bank ABC, yang bertanggung jawab untuk memberikan rekomendasi kepada Direktur Utama. Dalam rangka mengevaluasi eksposur risiko, RMC PT Bank ABC mengadakan pertemuan yang dilaksanakan sekurang-kurangnya satu kali dalam tiga bulan.

RMC ditetapkan untuk menyesuaikan dengan kebutuhan internal, dengan beberapa pokok perubahan sebagai berikut:

1. Perubahan keanggotaan RMC, dengan menetapkan Direksi PT Bank ABC sebagai anggota tetap dengan hak *voting* sedangkan pejabat setingkat di bawah Direksi merupakan anggota tetap tanpa hak *voting*. *Voting* dilakukan apabila tidak tercapai kesepakatan dalam pengambilan keputusan pada rapat RMC dan memenuhi persyaratan apabila disetujui oleh $\frac{1}{2} + 1$ dari anggota tetap dengan hak *voting* yang hadir.
2. Penambahan anggota tetap tanpa hak *voting* sehubungan dengan adanya beberapa divisi baru di kantor pusat PT Bank ABC.
3. Pengaturan tata kerja pelaksanaan sub RMC (*Credit Risk Management Committee*, *Operational Risk Management Committee* dan *Market Risk Management Committee*)

3.1.2.6. Business Continuity Management (BCM)

Untuk menjaga kelangsungan bisnis bank, baik dalam kondisi normal maupun kondisi terjadinya bencana atau gangguan, telah mendorong PT Bank ABC untuk menerapkan

suatu Manajemen Kelangsungan Usaha (*Business Continuity Management*) dalam mempertahankan kelangsungan proses bisnis kritikal, menjaga aset PT Bank ABC dan memiliki respon yang memadai ketika menghadapi situasi gangguan atau bencana.

Sebagai wujud keseriusan PT Bank ABC dalam mengembagkan *Business Continuity Management* (BCM) PT Bank ABC, pada bulan Juni 2007 Direksi PT Bank ABC telah membentuk Tim Poryek Pengembangan BCM PT Bank ABC sehingga pengembangan BCM serta proses implementasinya dapat berjakan secara efektif dan efisien serta mencapai sasaran yang telah ditetapkan. Hasil yang diharapkan dari penerapan BCM yang efektif adalah:

1. PT Bank ABC mampu mengidentifikasi dampak dari suatu gangguan atau bencana
2. PT Bank ABC memiliki suatu perencanaan pemuliah (*Rencana Kelangsungan Usaha/ Business Continuity Plan*) yang mampu meminimalisasi potensi kerugian dari suatu gangguan atau bencana.
3. PT Bank ABC tetap dapat memberikan pelayanan kepada nasabah dan menjaga kelangsungan bisnis bank.
4. Koordinasi antara unit kerja PT Bank ABC dalam penanggulangan gangguan atau bencana semakin meningkat dan terintegrasi.

3.1.2.7. Disaster Recovery Plan (DRP)

Disaster Recovery Plan (DRP) merupakan bagian dari BCM PT Bank ABC, oleh sebab itu PT Bank ABC secara berkala melakukan pengujian yang bertujuan untuk memastikan kemampuan *host BANK ABCNETS DRC* dapat berfungsi sebagai *host production*. Untuk menguji kemampuan DRC, BANK ABC melakukan switch over secara berkala pada tahun 2007 telah dilakukan *switch over* keempat DC-DRC-DC, dengan fokus pengujian pada uji coba transaksi ATM secara *live* untuk ATM PT Bank ABC di seluruh Indonesia selama 1 jam atau 1.000 transaksi (mana yang lebih dahulu tercapai) dan uji coba pada 4 (empat) unit kerja *on line* di wilayah Jakarta dan Tabanan – Bali yaitu kantor cabang PT Bank ABC Tabanan – Bali, kantor cabang pembantu Kediri di Tabanan – Bali, kantor unit Gatot Subroto Denpasar – Bali dankantor unit Bendungan Hilir Jakarta.

3.1.2.8. Pengelolaan Produk dan Aktivitas Baru Pengelolaan Risiko

Pengelolaan risiko pada setiap produk dan atau aktivitas baru merupakan salah satu tahapan yang harus dilalui dalam pengembangan bisnis PT Bank ABC. Tahapan ini diharapkan dapat meminimalkan potensi risiko yang tidak terduga akibat pelayanan produk atau aktivitas baru dimaksud.

Manajemen risiko berperan mengkaji usulan pengelolaan risiko pada produk dan atau aktivitas baru untuk memastikan kesiapan PT Bank ABC dalam menjalankan produk dan atau aktivitas baru dan merekomendasikan pengelolaan risiko kepada Direktur Manajemen Risiko.

3.1.2.9. Program Sosialisasi Mitigasi Risiko

Untuk menanamkan dan mengembakan paradigma bahwa yang paling bertanggung jawab terhadap pelaksanaan mitigasi risiko (*the ultimate risk owner*) atas setiap aktivitas yang dilakukan adalah unit kerja operasional, maka diperlukan upaya pengembangan budaya risiko. Divisi Manajemen Risiko sebagai unit kerja manajemen risiko perlu menempatkan diri sebagai mitra strategi untuk mendukung unit kerja operasional pengembangan budaya risiko. Dengan budaya risiko yang berkembang, kemampuan mitigasi risiko setiap insan PT Bank ABC akan meningkat. Disamping itu, unit kerja operasional akan mampu melakukan identifikasi, pengukuran, pengendalian di samping pemantauan terhadap setiap risikoyang dapat menimbulkan kerugian.

Sehubungan dengan hal tersebut, PT Bank ABC telah menerapkan aspek manajemen risiko pada target penilaian kinerja pekerja, simulasi penilaian kinerja unit kerja berbasis risiko, dan secara rutin memberikan pelatihan dan sosialisasi manajemen risiko kepada seluruh pekerja PT Bank ABC.

3.2. Pengumpulan Data

Data yang dikumpulkan adalah sebagai berikut

- a. Data kurs yang digunakan merupakan kurs tengah dari kurs penutupan transaksi jual dan transaksi beli Bank Indonesia untuk mata uang USD, EUR, JPY dan GBP terhadap Rupiah (IDR). Periode data kurs adalah sebanyak 1000 titik yaitu dari 12 Januari 2004 sampai dengan 31 Desember 2007.

- b. Data PDN merupakan posisi PDN akhir hari mata uang USD, EUR, JPY, dan GBP yang dimiliki PT Bank ABC tanggal 24 Desember 2007 sampai dengan 31 Desember 2007. Data PDN yang digunakan sudah dikonversi dalam Rupiah

3.2.1. Menghitung *Return* Nilai Tukar

Return nilai tukar dihitung dengan pendekatan logaritma normal dengan menggunakan persamaan (2.2)

3.3. Estimasi Volatilitas Model

Untuk melakukan perhitungan estimasi volatilitas model ARCH/GARCH, harus dilakukan beberapa pengujian terhadap data *return*. Adapun langkah-langkah yang dilakukan adalah sebagai berikut:

3.3.1. Uji Stationeritas

Dalam melakukan analisis *time series*, data harus berada dalam keadaan stationer, yaitu data memiliki *mean* yang konstan. Dengan demikian data cenderung bergerak atau berfluktuasi di sekitar nilai *mean*. Untuk mengamati data *time series* stationer atau tidak dapat dilakukan secara grafis melalui pola autokorelasi (*correlogram*) data tersebut. Nilai fungsi autokorelasi yang turun dengan lambat seiring dengan bertambah besarnya *lag* mengindikasikan bahwa data tidak stasioner. Pemeriksaan kestasioneran melalui pengamatan pola grafik data runtun waktu maupun melalui pola autokorelasi data awal adalah pemeriksaan yang bersifat informal. Pemeriksaan yang formal dilakukan melalui uji yang lebih baik, yaitu *Unit Root Test* dengan menggunakan statistik uji *Augmented Dickey Fuller (ADF)*. Apabila terdeteksi adanya *unit root* pada tahap pengujian awal maka harus dilakukan diferensi terhadap data awal. Jika diferensi orde pertama data masih belum keadaan stasioner, dilakukan diferensi orde kedua.

Data hasil diferensi sudah stasioner atau belum diuji dengan menggunakan ADF Test. Parameter yang digunakan untuk menentukan bahwa data memiliki *unit root* atau tidak adalah nilai ADF Test dibandingkan dengan 1% *critical value MacKinnon*. *Null Hypothesis* dan alternatif hipotesis adalah sebagai berikut:

H_0 : ada *unit root*/ data belum stationer, jika nilai ADF Test lebih besar dari 1% *critical value*

H_1 : tidak ada *unit root*/ data stationer, jika nilai ADF Test lebih kecil dari 1% *critical value*

3.3.2. Uji Normalitas

Uji normalitas dengan menggunakan *Jarque-Bera test*. Prosedur yang dilakukan adalah sebagai berikut

- H_0 : Distribusi *return* nilai tukar normal
- H_1 : Distribusi *return* nilai tukar tidak normal
- *Critical Value* (CV) = χ^2 , df : 2
- Test Statistik *Jarque-Bera*

$$JB = n \left[\frac{S^2}{6} + \frac{(K-3)^2}{24} \right]$$

Nilai JB untuk masing masing nilai tukar diperoleh dengan bantuan *Eviews 5*

3.3.3. Uji White Heteroskedastis

Uji heteroskedastisitas dilakukan untuk melihat apakah model yang diperoleh masih terdapat autokorelasi atau tidak. Uji heteroskedastisitas dilakukan terhadap *residual* dan *kuadrat residual*.

3.3.3.1. Uji Autokorelasi Residual

Setelah mendapatkan model *mean* (*mean equation*), langkah selanjutnya adalah memeriksa keberadaan autokorelasi residual. Statistik uji yang digunakan adalah *Q-Stat* atau *Ljung-Box stat* dengan hipotesis

H_0 : Tidak ada autokorelasi residual hingga lag k, jika *p-value* dari nilai *Q-Statistics* kurang dari 5%

H_1 : Sekurang-kurangnya terdapat autokorelasi residual pada sebuah lag k tertentu, jika *p-value* dari nilai *Q-Statistics* lebih besar dari 5%

k : Lag tertinggi yang dipilih (untuk penelitian ini , akan digunakan angka default software versi 5 yaitu k = 36)

Apabila ditemukan *spike*, yaitu nilai autokorelasi residual yang melewati batas standar yang dibatasi oleh $2/\sqrt{T}$ dan probabilitas (*p-value*) yang besarnya kurang dari 0.05 pada sebuah *lag* tertentu, maka hal ini mengindikasikan diperlukan nilai *return* di masa

lalu untuk diikutsertakan dalam model *mean (mean equation)* tentatif yang telah diperoleh sebelumnya.

3.3.3.2. Uji Autokorelasi Kuadrat Residual

Jika dari uji residual di atas berakhir pada penerimaan H_0 yang berarti tidak ditemukan lagi indikasi adanya autokorelasi residual pada setiap *lag*, maka langkah selanjutnya adalah menguji keberadaan autokorelasi kuadrat residual. Uji autokorelasi kuadrat residual analog dengan uji autokorelasi residual di atas, hanya saja data runtun waktu yang digunakan untuk melakukan pengujian adalah kuadrat residual. Statistik uji yang digunakan sama, yaitu Q (*Ljung-Box stat*), dengan hipotesis:

H_1 : Sekurang-kurangnya terdapat autokorelasi residual pada sebuah *lag* k tertentu, jika *p-value* dari nilai statistik uji Q lebih besar dari 5%

$K = 1, 2, \dots, K$

3.4. Permodelan ARCH/GARCH

Permodelan dengan ARCH/GARCH dilakukan jika terdapat autokorelasi pada residual. Sehingga model yang dihasilkan bersifat heteroskedastisitas atau menunjukkan adanya *conditional variance* yang signifikan. Proses estimasi dilakukan untuk mencari parameter-parameter GARCH yang signifikan di dalam residual. Dalam proses estimasi ini perlu diperhatikan adanya batasan-batasan agar diperoleh model yang stasioner dengan *unconditional variance* tertentu dimana gerakan *conditional variance* akan menuju nilai tersebut. Proses estimasi tersebut dihentikan bila residual telah bersifat homoskedastis.

1. *Conditional Variance*

Dalam proses residual terdapat dua jenis *variance*, yaitu *conditional variance* dan *unconditional variance*. Kata *conditional* menunjukkan ketergantungan nilai varian tersebut pada data sebelumnya dalam suatu observasi. Sedangkan *unconditional* menjelaskan karakteristik jangka panjang data *time series* dengan asumsi tidak ada pengaruh informasi masa lalu. Model GARCH mengkararakteristikan distribusi *conditional* tersebut, dapat dilihat $p = q = 0$, maka proses varian tersebut adalah *white noise* dengan varian α .

2. Homoskedastisitas dan *Unconditional Variance*

Untuk memenuhi kondisi homoskedastisitas, model ARCH/GARCH yang dibentuk harus memenuhi batasan-batasan parameter sebagai berikut (Alexander, 2001:72)

$$\sum_{i=1}^q \alpha_i + \sum_{j=1}^p \beta_j < 1$$

Batasan ini diperlukan agar terpenuhi kondisi stasioner. Dengan demikian akan dihasilkan *conditional variance* pada residual yang memiliki *mean* tertentu dan tidak bergantung pada waktu. Sedangkan batasan $\alpha \geq 0$, $\alpha_i \geq 0$, $\beta_j \geq 0$ digunakan untuk memastikan bahwa varian yang dihasilkan memiliki nilai yang selalu positif.

3.4.1. Analisis nilai *Adjusted R-Squared*, *AIC* dan *Schwarz Criterion*

Statistik *R-Squared* mengukur keberhasilan regresi dalam memperkirakan nilai dari variabel tidak bebas di dalam sample. Dalam keadaan standar, dapat diinterpretasikan sebagai fraksi *variance* dari variabel tidak bebas yang dijelaskan variabel bebas. Nilai statistik akan sama dengan satu jika regresi sesuai, dan nol jika tidak sesuai dengan rata-rata dari variabel tidak bebas. *R-squared* dapat bernilai negatif dengan beberapa alasan seperti, jika regresi tidak mempunyai *intercept* atau konstanta, regresi mengandung koefisien pembatas atau metoda estimasi dalam *two-stage least squares* atau ARCH.

Pengujian *Adjusted R-Squared*, *Akaike Info Criterion* dan *Schwarz Criterion* dilakukan untuk memeriksa validitas dari model yang dibentuk. Dengan menggunakan pengukuran-pengukuran ini dapat diuji pengaruh variabel bebas dan *lag* terhadap variabel tak bebas dalam model yang dibentuk. Berikut ini uraian mengenai metoda tersebut.

a. *Adjusted R-squared*

Salah satu masalah menggunakan *R-squared* sebagai ukuran keberhasilan regresi adalah bahwa *R-Squared* tidak pernah berkurang dengan bertambahnya regresor. Nilai *Adjusted R-squared* digunakan untuk mengukur persentasi variabilitas variabel tidak bebas yang dapat dijelaskan oleh variabel-variabel bebas. Nilai *Adjusted R-squared* yang besar (mendekati satu) menunjukkan model yang dibentuk telah cukup baik dan sesuai. Oleh karena itu proses pembentukan model biasanya kan terus berlanjut hingga diperoleh nilai *Adjusted R-squared* yang paling maksimal. Nilai *Adjusted R-squared* tidak pernah lebih besar dari *R-squared* dan dapat berkurang dengan bertambahnya regresor.

b. *Akaike Info Criterion*

Akaike Info Criterion (AIC) dan *Schwarz Criterion* (SC) adalah alternatif lain dari *adjusted R-squared* yang digunakan untuk mengukur validitas model yang dihasilkan. Berlawanan dengan *adjusted R-squared*, semakin kecil nilai yang dihasilkan dari kedua parameter tersebut berarti semakin baik model yang dibentuk.

3.5. Permodelan EWMA

The exponentially weighted moving average (EWMA) adalah suatu model dimana bobot α_1 menurun secara eksponensial dari waktu ke waktu. Terutama jika $\alpha_{i+1} = \lambda \alpha_i$, dimana λ adalah suatu nilai yang konstan antara 0 dan 1.

Skema pembobotan ini mengacu pada formula yang mudah untuk memperkirakan volatilitas. Dan formulanya adalah sebagai berikut:

$$\sigma^2 = \lambda \sigma_{n-1}^2 + (1-\lambda) u_{n-1}^2$$

Estimasi dari σ_n , volatilitas dari hari ke n (dibuat pada akhir hari ke $n - 1$) dihitung dari σ_{n-1} (estimasi yang dibuat pada akhir hari ke $n - 2$ dari suatu volatilitas untuk hari ke $n-1$) dan U_{n-1} (lebih pada perubahan persen harian).

Agar dapat lebih dimengerti mengenai bobot menurun secara eksponensial, kita mengganti untuk σ_{2n-1} untuk memperoleh

$$\sigma^2 = \lambda (\sigma_{n-2}^2 + (1-\lambda) u_{n-2}^2) + (1-\lambda) u_{n-1}^2$$

$$\sigma^2 = (1-\lambda) (\sigma_{n-2}^2 + (1-\lambda) u_{n-2}^2) + \lambda^2 u_{n-1}^2$$

Substitusikan dengan cara yang sama seperti diatas untuk σ_{n-2}^2 sehingga menjadi sebagai berikut:

$$\sigma^2 = (1-\lambda) (u_{n-2}^2 + \lambda u_{n-2}^2 + \lambda^2 u_{n-3}^2) + \lambda^3 u_{n-3}^2$$

kemudian lakukan proses seperti ini

$$\sigma^2 = (1-\lambda) \sum \lambda^{i-1} u_{n-i}^2 + \lambda^m u_{n-m}^2$$

Untuk m besar, termin dari $\lambda^m u_{n-m}^2$ akan menjadi terlalu kecil untuk diabaikan sehingga persamaan tersebut akan menjadi sama seperti persamaan pertama dengan $\alpha_i = (1 - \lambda) \lambda^{i-1}$. Bobot ini untuk u yang menurun pada rate λ yang lalu. Setiap bobot adalah λ kali dengan bobot sebelumnya.

Pendekatan EWMA mempunyai bentuk yang atraktif yang secara relatif memerlukan data yang kecil untuk disimpan. Dengan jangka waktu yang *given*, kita memerlukan untuk mengingat hanya estimasi sekarang ini dari rata rata *variance* dan lebih

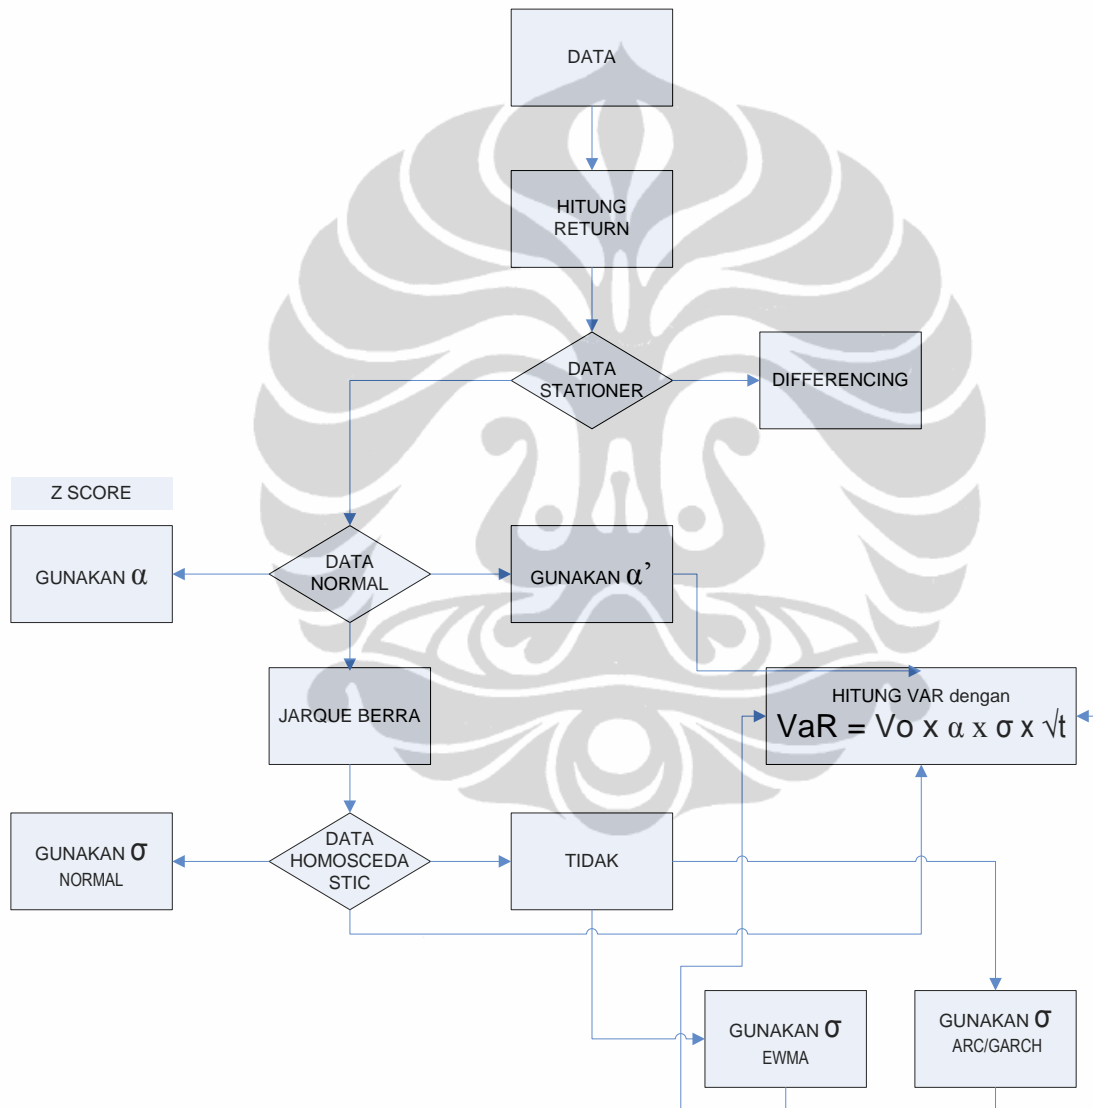

dari observasi sekarang ini pada nilai pasar yang variabel. Ketika kita mendapatkan observasi yang baru dari *market variable*, kita menilai perubahan persentase harian dan menggunakan persamaan dari rumus-rumus untuk memperbaharui estimasi kita dengan rate dari suatu *variance*. Estimasi lama dari *rate variance* dan nilai yang lebih tua dari *market variable* dapat diabaikan..

Pendekatan EWMA dirancang untuk dapat melihat perubahan dari suatu volatilitas. Diibaratkan bahwa terjadi pergerakan yang besar pada *market variable* pada hari ke $n - 1$, lalu U_{n-1}^2 nilainya tinggi. Dari persamaan di atas tersebut mengakibatkan perkiraan volatilitas saat ini bergerak ke atas. Nilai dari *lamda* lebih responsif diperkirakan dari suatu volatilitas perubahan persentase harian. Nilai yang rendah suatu *lamda* mengarah kepada nilai yang bagus dari suatu bobot yang diberikan oleh U_{n-1}^2 ketika α dihitung. Dalam kasus ini, estimasi volatilitas yang diproduksi sangat *volatile* sekali. Nilai *lamda* memproduksi perkiraan volatilitas harian yang akhirnya akan menyediakan informasi yang baru dengan persentase perubahan harian.

Riskmetrics database, dimana awalnya dibuat oleh J.P. Morgan dan dipublikasikan pada tahun 1994 ini menggunakan EWMA model dengan *lamda* 0,94 untuk memperbaharui perkiraan volatilitas harian dari *Riskmetrics database*. Perusahaan akan menemukan bahwa, nilai yang bersebrangan dengan variabel pasar yang berbeda nilai *lamda* akan memberikan perkiraan *rate* dari varian yang akan dekat dengan *rate* varian yang sebenarnya. Nilai *rate variance* yang sebenarnya dihitung secara rata-rata tertimbang pada nilai u^2 pada 25 berikutnya.

Untuk lebih jelasnya alur metodologi penelitian perhitungan VaR akan dituangkan pada gambar 3.1. berikut ini :

Gambar 3.1. PROSEDUR PENGUKURAN VaR

BAB IV

ANALISA PEMBAHASAN

Bab ini menguraikan tentang langkah-langkah pengujian data *return* untuk masing-masing nilai tukar, menghitung *VaR*, dan terakhir adalah melakukan perhitungan volatilitas dengan menggunakan model EWMA dan GARCH.

4.2. Pengujian Data *Return*

4.2.1. Penentuan Data Observasi

Data observasi yang digunakan dalam penelitian ini adalah data harian kurs pada www.bi.go.id pada 4 (empat) nilai tukar mata uang asing yaitu *United States Dollar (USD)*, *Euro (EUR)*, *Japanese Yen (JPY)*, *UK Poundsterling (GBP)*. Periode penelitian adalah sebanyak 1000 titik dimulai dari tanggal 12 Januari 2004 sampai dengan 31 Desember 2007. Pemilihan nilai tukar mata uang asing tersebut didasarkan pada nilai tukar yang paling aktif diperdagangkan dalam transaksi valuta asing.

4.2.2. Penentuan Data *Return*

Return masing-masing nilai tukar dihitung dengan pendekatan *logaritma natural* dari rasio harga yang dihitung dengan persamaan (2.3). Contoh hasil perhitungan *return* untuk nilai tukar USD, EUR, JPY dan GBP terhadap IDR disajikan pada Lampiran I.

4.2.3. Pengujian Stasioneritas

Tujuan pengujian ini adalah untuk mengetahui data *return* empat nilai tukar yang diobservasi bersifat stasioner atau tidak. Uji stasioner dilakukan dengan *Augmented Dikey Fuller Test* atau ADF-test, jika data mengandung *unit roots* maka data tersebut belum stasioner, tetapi jika tidak mengandung *unit roots* maka data sudah stasioner. Data yang stasioner memiliki *mean* dan *variance* yang konstan yang hanya tergantung pada variabel waktu dari data yang diobservasi.

Dalam melakukan pengujian stasioner atau tidaknya data yang diobservasi, *ADF-test statistic* dibandingkan dengan *test critical values* 5%. Data yang stasioner bila nilai

ADF-test statistik $>$ *test critical values* 5% level. *Output ADF test* dihasilkan melalui pengolahan data *return* dengan bantuan *software Eviews 4.1*.

Dengan Hipotesis nol (H_0) data non stasioner, maka hasil perhitungan tersebut maka dihasilkan nilai *ADF Test Statistic* untuk data *return* nilai USD sebesar $-33.05860 <$ *test critical value* 5% level *MacKinnon* sebesar $- 3.414323$ sehingga dari data tersebut sudah stasioner.

Tabel 4.1
Contoh Hasil Perhitungan ADF-test untuk Nilai Tukar USD

Null Hypothesis: RETURN_EUR has a unit root Exogenous: Constant, Linear Trend Lag Length: 0 (Automatic based on AIC, MAXLAG=21)

3	JPY	-32.73455	-3.414318	Stationer
4	GBP	-31.85177	-3.414318	Stationer

Sumber : www.bi.go.id diolah kembali dengan Eviews.

Maka langkah selanjutnya dalam pengujian data *return* ini dengan Pengujian Normalitas.

4.2.4. Pengujian Normalitas

Pengujian normalitas dilakukan untuk mengetahui apakah distribusi *return* normal atau tidak. Pengujian dilakukan dengan membandingkan nilai *Jarque-Bera (JB)* dengan *Chi Square (χ^2)* dengan *degree of freedom 2 (df=2)*. Data dikatakan normal jika nilai $\alpha = 5\%$ dan $df = 2$ yaitu nilai χ^2 sebesar 5,99146. Dengan hipotesis nol (H_0) distribusi *return* adalah normal, jika $JB > \chi^2$ maka tolak H_0 , sebaliknya jika $JB < \chi^2$ maka H_0 tidak ditolak

Statistik *Jarque-Bera (JB)* secara asimtotis merupakan distribusi *Chi Square* dengan *degree of freedom 2* pada residual yang berdistribusi norma atau probabilitasnya sekitar 0,6781. Semakin kecil probalitas statistik JB atau mendekati 0 maka hipotesis bahwa residual memiliki distribusi normal ditolak.

Jika nilai JB kurang dari nilai *Chi Square χ^2* ($\alpha = 5\%$ dan $df = 2$ yaitu nilai χ^2 sebesar 5,99146 %) yang berarti data memiliki distribusi normal dan besarnya *skewness* adalah nol. Sebaliknya jika nilai $JB > \chi^2$ maka data tidak memiliki distribusi normal sehingga harus menggunakan *alpha prime* atau α' . *Alpha prime* diperoleh dengan menggunakan persamaan *Cornish Fisher Expansion* (Jorion, 2001, 213) dengan rumus sebagai berikut:

$$\alpha' = \alpha - 1/6 (\alpha^2 - 1) \zeta$$

dimana :

$\alpha = \text{confidence level}$

$\zeta = \text{skewness}$

Hasil dari pengujian normalitas untuk data *return* nilai tukar USD menggunakan software Eviews 4.1. dapat dilihat pada Grafik 4.1. Hasil perhitungan nilai *Jarque-Bera*

untuk data *return* nilai USD diperoleh nilai 8695.679. Nilai ini lebih besar dari nilai *Chi Square* χ^2 sebesar 5,99146 %. Dapat disimpulkan dari pengujian tersebut bahwa data *return* nilai USD tersebut tidak memiliki distribusi normal.

Di bawah ini merupakan hasil dari pengujian normalitas untuk data *return* empat nilai tukar yang diobservasi pada tabel 4.3. berikut

Tabel 4.3.
Hasil Perhitungan Tes Normalitas untuk Empat Nilai Tukar

No	Return	Jarque-Bera	Probability	Chi Square (x2)	Normalitas
1	USD	8869.2600	0	5.99146	Tidak Normal
2	EUR	1000.4580	0	5.99146	Tidak Normal
3	JPY	1154.3040	0	5.99146	Tidak Normal
4	GBP	1668.1540	0	5.99146	Tidak Normal

Sumber : Bank Indonesia, diolah kembali dengan aplikasi *Eviews*

Setelah perhitungan pada Tabel 4.4 diatas, dapat disimpulkan bahwa keempat data *return* diatas tidak memiliki distirbusi normal dengan perbandingan antara nilai Jarque-Bera > Chi Square χ^2 sebesar 5,99146 %. Maka α harus dikoreksi dengan menggunakan *Cornish Fisher Expansion*. Hasil perhitungannya dapat dilihat pada Tabel 4.4.

Tabel 4.4.
Hasil Perhitungan Cornish Fisher Expansion

No	Return	Skewness (ξ)	α (0.95)	$\alpha' = \alpha - 1/6 (\alpha^2 - 1) \times \xi$
1	USD	0.17019	1.64485	1.59648
2	EUR	-0.03791	1.64485	1.65563
3	JPY	0.26540	1.64485	1.56941
4	GBP	-0.13785	1.64485	1.68404

Sumber : Bank Indonesia, diolah kembali dengan aplikasi *Eviews*

Maka Tabel 4.4. diatas memperlihatkan nilai α' untuk data *return* USD menjadi 1,59648. Angka ini menjadi angka yang akan digunakan untuk perhitungan VaR untuk aset USD.

4.2.5. Pengujian White Heteroskedastic

Pengujian *white test* ini adalah untuk mengetahui apakah varian *return* konstan (*homoscedastic*) atau tidak konstan (*time varying*). Apabila varian *return* ini adalah konstan maka standar deviasi dihitung dengan menggunakan standar deviasi statistik menggunakan perhitungan standar deviasi oleh *Watsham*. (persamaan 2.6).

Jika diperoleh hasil dari pengujian diatas bahwa varian adalah tidak konstan (*heteroskedastic*), maka standar deviasi harus dihitung menggunakan GARCH atau EWMA, tidak bisa menggunakan standar deviasi statistik biasa. Untuk menghitung volatilitas dengan metode GARCH (1,1) digunakan persamaan (2.7), sedangkan untuk menghitung volatilitas dengan menggunakan metode EWMA menggunakan persamaan (2.12).

Pengujian *White Test* ini menggunakan *software Eviews 4.1* dengan melihat *Probability F-statistic* (p) pada masing-masing nilai tukar. Jika *Probability F-statistic* < 5%, maka varian data *return* adalah *heteroskedastic*. Sebaliknya jika *Probability F-statistic* > 5% varian data *return* adalah *homoskedastic*. Hasil perhitungan *White Test* untuk data *return* nilai tukar USD sebagai berikut:

Tabel 4.5.
Hasil Perhitungan Pengujian White Heteroscedastic Data Return USD

White Heteroskedasticity Test:				
F-statistic	208.0868	Probability	0.000000	
Obs*R-squared	294.3233	Probability	0.000000	
Test Equation:				
Dependent Variable: RESID^2				
Method: Least Squares				
Date: 05/14/08 Time: 08:13				
Sample: 3 1000				
Included observations: 998				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1.48E-05	3.07E-06	4.818428	0.0000
RESID_USD(-1)	0.005092	0.000566	8.997370	0.0000
RESID_USD(-1)^2	0.469248	0.026763	17.53322	0.0000
R-squared	0.294913	Mean dependent var	2.79E-05	
Adjusted R-squared	0.293496	S.D. dependent var	0.000112	
S.E. of regression	9.42E-05	Akaike info criterion	-15.70008	
Sum squared resid	8.82E-06	Schwarz criterion	-15.68533	
Log likelihood	7837.341	F-statistic	208.0868	
Durbin-Watson stat	1.857990	Prob(F-statistic)	0.000000	

Dari tabel diatas dapat dilihat bahwa nilai *Probability F-statistic* untuk data *return* USD sebesar $0,00000 < 5\%$ artinya data tersebut adalah *heteroskedastic*. Tabel 4.6. merupakan rangkuman seluruh pengujian dari empat nilai tukar yang diobservasi sebagai berikut :

Tabel 4.6.
Pengujian White Heteroskedastic Test

No	Return	Probabiliy F-Statistic	Hasil	Kesimpulan
1	USD	0.00000	P Value < 5%	Data <i>Heteroskedastic</i>
2	EUR	0.00000	P Value < 5%	Data <i>Heteroskedastic</i>
3	JPY	0.00000	P Value < 5%	Data <i>Heteroskedastic</i>
4	GBP	0.00000	P Value < 5%	Data <i>Heteroskedastic</i>

Sumber : Bank Indonesia, diolah kembali dengan aplikasi *Eviews*

Dari tabel diatas, dapat disimpulkan bahwa ke-empat nilai tukar memiliki *Probability F-statistic* < 5% artinya data *return* tersebut *heteroskedastic*. Sehingga standar deviasi atau volatilitas tidak dapat dihitung dnegan menggunakan persamaan standar deviasi statistik tetapi harus menggunakan estimasi *volatilitas* GARCH atau EWMA.

4.3. Perhitungan Value At Risk (VaR)

4.3.1. Mencari Model GARCH terbaik

Dalam menentukan model GARCH yang terbaik, maka dilakukan percobaan terhadap mean dan variance process, yaitu dengan varibel AR, MA maupun ARCH dan GARCH. Model ini diperoleh dengan cara melakukan berbagai iterasi terhadap *mean* dan *variance*. Kriteria yang digunakan untuk menentukan model GARCH yang terbaik adalah parameter *Probability*, *Adjusted R-squared*, *Akaike Info Criterion* (AIC) dan *Schwarz Criterion* (SC).

Untuk mengetahui apakah variabel yang digunakan signifikan atau tidak, maka dilakukan uji signifikansi dengan *alpha* (α) sebesar 5%. Dengan hipotesis nol (H_0) variabel tidak signifikan, dan jika Probabilitas < α maka tolak. Sebaliknya jika Probabilitas $\geq \alpha$ maka tidak menolak H_0 . Hasil uji signifikansi untuk masing-masing nilai tukar terdapat pada Lampiran XIV.

Hasil parameter yang signifikan diperoleh dari berbagai variasi model kemudian setelah itu dilakukan pemilihan model yang terbaik berdasarkan *Adjusted R-square*, AIC dan SC tersebut. Model tersebut adalah model yang memiliki probabolity signifikan, nilai

parameter *Adjusted R-Square* tertinggi, nilai AIC dan SC terkecil. Lampiran XIV adalah variasi model yang ditampilkan karena memenuhi berbagai kriteria tersebut.

4.3.1.1. Model GARCH Terbaik untuk Nilai Tukar USD

Parameter yang signifikan dalam pemilihan Model GARCH terbaik untuk nilai tukar USD dengan membandingkan nilai *Adjusted R-Square*, AIC dan SC. Model terbaik dipilih berdasarkan nilai *Adjusted R-Square* tertinggi, AIC terkecil dan SC terkecil. Tetapi pemilihan tersebut dipilih setelah *probability* untuk masing masing model lebih dari 5%. Rincian model dilihat pada Tabel 4.7 berikut :

Tabel 4.7.
Model GARCH Terbaik untuk Nilai Tukar USD

<i>Model</i>	<i>Probability</i>	<i>Adjusted R²</i>	<i>AIC</i>	<i>SC</i>	<i>Significant Model</i>
ARCH(1)	0.0000	-0.014901	-7.889190	-7.869543	√
ARCH(1)	0.0000	-0.000402	-7.902779	-7.878220	√
ARCH(2)	0.0004				
ARCH(1)	0.0000	-0.002853	-7.983616	-7.959058	√
GARCH(1)	0.0000	-0.003259	-8.003380	-7.973910	χ
ARCH(1)	0.0000				
GARCH(1)	0.0647				
GARCH(2)	0.0000	-0.003224	-7.986145	-7.956675	√
ARCH(1)	0.0000				
ARCH(2)	0.0070				
GARCH(1)	0.0000				
ARCH(1)	0.0000	-0.004295	-8.000144	-7.967056	χ
ARCH(2)	0.7949				
GARCH(1)	0.5967				
GARCH(2)	0.0000				

Sumber : BI, diolah kembali dengan Aplikasi Excell dan Eviews 4.1

Dari hasil pengujian diatas maka model yang memiliki *probability* yang signifikan, nilai parameter *Adjusted R-Square* tertinggi, nilai AIC dan SC terkecil adalah model ARCH(1) ARCH (2) GARCH (1) karena model ini memiliki 2 (dua) dari 3 (tiga) kriteria sebagai model yang terbaik.

4.3.1.2. Model GARCH Terbaik untuk Nilai Tukar EUR

Model GARCH terbaik untuk Nilai Tukar EUR dapat dilihat dari hasil pengolahan dengan *Eviews* berikut :

Tabel 4.8.
Model GARCH Terbaik untuk Nilai Tukar EUR

<i>Model</i>	<i>Probability</i>	<i>Adjusted R²</i>	<i>AIC</i>	<i>SC</i>	<i>Significant Model</i>
ARCH(1)	0.0000	-0.001595	-7.243682	-7.224035	√
ARCH(1)	0.0000	-0.002589	-7.242824	-7.218266	χ

GARCH(1)	0.1082				
GARCH(2)	0.0000				
ARCH(1)	0.0000	-0.004140	-7.309430	-7.279973	√
ARCH(2)	0.0001				
GARCH(1)	0.0000				
ARCH(1)	0.0000	-0.005083	-7.312851	-7.278470	√
ARCH(2)	0.0006				
GARCH(1)	0.0000				
GARCH(2)	0.0000				

Sumber : BI, diolah kembali dengan Aplikasi Excell dan *Eviews* 4.1

Dari hasil diatas untuk memenuhi kriteria model yang memiliki probability yang signifikan, nilai parameter *Adjusted R-Square* tertinggi, nilai AIC dan SC terkecil dalam model adalah ARCH (1) ARCH (2) GARCH (1) tetapi berdasarkan *Parsimony Theorem* yaitu pemilihan nilai yang kecil lebih baik agar mendapatkan model yang lebih sederhana dengan selisih yang sangat kecil maka model yang dipilih adalah model ARCH (1) GARCH (1). Disamping memenuhi 2 (dua) dari 3 (tiga) kriteria dan memiliki model yang lebih simpel dibanding model-model yang lain.

4.3.1.3. Model GARCH Terbaik untuk Nilai Turkar JPY

Nilai tukar JPY mempunyai Model GARCH terbaik dengan memilih sama seperti nilai tukar yang lain yaitu berdasarkan nilai *Adjusted R-Square* tertinggi, AIC terkecil dan SC

terkecil. Dan berdasarkan *Parsimony Theorem* pula yang memenuhi ketiga diatas dengan perhitungan sebagai berikut:

Tabel 4.9
Model GARCH Terbaik untuk Nilai Tukar JPY

<i>Model</i>	<i>Probability</i>	<i>Adjusted R²</i>	<i>AIC</i>	<i>SC</i>	<i>Significant Model</i>
ARCH(1)	0.0000	-0.002206	-7.147722	-7.128076	√
ARCH(1)	0.2588	-0.003716	-7.150183	-7.125624	χ
ARCH(2)	0.0577				
ARCH(1)	0.0000	-0.003865	-7.1941	-7.169541	√
GARCH(1)	0.0000				
ARCH(1)	0.0000	-0.004734	-7.194922	-7.165452	√
GARCH(1)	0.0005				
GARCH(2)	0.0088				
ARCH(1)	0.0000	-0.004612	-7.197465	-7.167995	√
ARCH(2)	0.0007				
GARCH(1)	0.0000				
ARCH(1)	0.0000	-0.006359	-7.37849	-7.344109	χ
ARCH(2)	0.0032				
GARCH(1)	0.0000				
GARCH(2)	0.9073				

Sumber : BI, diolah kembali dengan Aplikasi Excell dan Eviews 4.1

Dari Tabel 4.9 diatas dapat disimpulkan sebagai model yang terbaik adalah ARCH (1) GARCH (1) karena semua kriteria nilai *Adjusted R-Square* tertinggi, AIC terkecil dan SC terkecil terpenuhi.

4.3.1.4. Model GARCH Terbaik untuk Nilai Tukar GBP

Untuk model GARCH terbaik Nilai Tukar GBP sama seperti dua pengujian sebelumnya yaitu parameter nilai *Adjusted R-Square*, AIC dan SC. Model terbaik dipilih berdasarkan nilai *Adjusted R-Square* tertinggi, AIC terkecil dan SC terkecil seperti hasil perhitungan di bawah ini:

Tabel 4.10
Model GARCH Terbaik untuk Nilai Tukar GBP

<i>Model</i>	<i>Probability</i>	<i>Adjusted R²</i>	<i>AIC</i>	<i>SC</i>	<i>Significant Model</i>
ARCH(1)	0.0000	-0.003397	-7.343471	-7.323824	√
ARCH(1)	0.0000	-0.004248	-7.344743	-7.320184	χ
ARCH(2)	0.1347				
ARCH(1)	0.0000	-0.004205	-7.373515	-7.348956	√
GARCH(1)	0.0000				
ARCH(1)	0.0000	-0.005299	-7.380355	-7.350885	χ
GARCH(1)	0.0516				
GARCH(2)	0.0000				
ARCH(1)	0.2026	-0.005114	-7.376638	-7.347168	χ
ARCH(2)	-0.1125				
GARCH(1)	0.8710				
ARCH(1)	0.1974	-0.006359	-7.378490	-7.344109	χ
ARCH(2)	0.0171				
GARCH(1)	0.0948				
GARCH(2)	0.5987				

Sumber : BI, diolah kembali dengan Aplikasi Excell dan Eviews 4.1

Hasil dari pengolahan *Eviews* diatas maka untuk yang memenuhi kriteria sebagai model yang terbaik adalah ARCH (1) GARCH (1) karena memiliki semua kriteria sebagai model yang terbaik yaitu nilai *Adjusted R-Square*, AIC dan SC. Model terbaik dipilih berdasarkan nilai *Adjusted R-Square* tertinggi, AIC terkecil dan SC terkecil. Sementara untuk model ARCH – GARCH yang lain mempunyai probability yang tidak signifikan karena lebih dari 5%.

4.3.1.5. Model GARCH Terbaik untuk Semua Nilai Tukar

Setelah mendapatkan model yang terbaik untuk semua nilai tukar maka selanjutnya melakukan *forecast variance* masing masing nilai tukar dengan menggunakan persamaan (2.9).

Model terbaik untuk semua nilai tukar berdasarkan percobaan-percobaan dengan rincian pada tabel 4.11 berikut :

Tabel 4.11
Model GARCH Terbaik untuk Semua Nilai Tukar

Sumber : BI, diolah kembali dengan Aplikasi Excell dan Eviews 4.1

Akar dari *forecast variance* adalah volatilitas return untuk masing-masing nilai tukar. Hasil dari pengolahan melalui *software Eviews 4.1* diperoleh nilai *forecast variance* dan volatilitas untuk masing masing nilai tukar pada Lampiran XXVII.

Hasil dari *forecast variance* dan volatilitas nilai tukar digunakan untuk perhitungan VaR untuk masing-masing nilai tukar. *Confidence level* yang digunakan dalam asumsi perhitungan VaR adalah 95% dan menggunakan *holding period* 1 hari. Hasil perhitungan secara lengkap VaR untuk semua nilai tukar dengan estimasi volatilitas GARCH ada pada Lampiran XXXVII.

Sehingga perlu dilakukan perhitungan dari parameter-parameter yang telah diuji dan dilakukan iterasi dalam model GARCH untuk masing-masing nilai tukar yang diobservasi. Dalam perhitungan ini VaR dengan estimasi volatilitasnya dikalikan satu sama lain sehingga menghasilkan total nilai VaR.

Di bawah ini adalah sebagian hasil perhitungan VaR dengan estimasi volatilitas GARCH untuk semua nilai tukar yang diobservasi pada tanggal 1 sampai dengan 4 Januari 2008.

Tabel 4.12.

Sumber : BI, diolah kembali dengan Aplikasi Excell dan Eviews 4.1

4.3.2. Menghitung VaR dengan Estimasi Volatilitas EWMA

Dalam melakukan *forecast volatility*, yang pertama harus dilakukan adalah mencari decay factor optimum. *Decay factor optimum* adalah *decay factor* yang memberikan *Root Mean Square Error* (RMSE) terkecil. Cara menghitungnya dengan menggunakan persamaan (2.13).

Trial and error nilai λ dalam persamaan (2.11) untuk masing masing nilai tukar kemudian λ yang memberikan nilai RMSE yang terkecil dipilih sebagai *decay factor optimum*. Penentuan *decay factor optimum* dari RMSE yang terkecil untuk data return keempat nilai tukar yang di observasi dapat dilihat pada lampiran XLVI

. Decay factor yang optimum tersebut ditampilkan pada tabel 4.13. sebagai berikut:

Tabel 4.13
Decay Factor Optimum

No	Return	RMSE	Decay Factor (λ)
1	USD	0.0000122012	0.68
2	EUR	0.0000134916	0.93
3	JPY	0.0000179142	0.93
4	GBP	0.0000143173	0.90

Sumber : BI, diolah kembali dengan Aplikasi Excell

Dari table 4.14, dapat diketahui bahwa USD memiliki *decay factor optimum* yang paling rendah yaitu sebesar 0,68. Decay factor optimum yang paling tinggi dimiliki oleh nilai tukar EUR dan JPY yaitu sebesar 0,93, GBP memiliki decay factor optimum sebesar 0.90.

Setelah mendapatkan nilai *decay factor optimum*, selanjutnya melakukan *forecast variance* dan volatilitas. Contoh perhitungan *forecast variance* disajikan dalam tabel 4.14 berikut:

Tabel 4.14

Sumber: BI, diolah kembali dengan aplikasi Excel

Dari tabel 4.14 tersebut diketahui bahwa *forecast variance* dan volatilitas untuk data *return* nilai tukar USD tanggal 31 Desember 2007 adalah sebesar 0,0000144321 dan 0,0035624701. Untuk data *return* nilai tukar EUR tanggal 31 Desember 2007 adalah sebesar 0,0000308673 dan 0,0055558315, untuk nilai tukar JPY sebesar 0,0000560139 dan 0,0074842415, sementara untuk nilai tukar GBP sebesar 0,0000278086 dan 0,0052733896.

Hasil perhitungan *forecast variance* dan volatilitas ke-empat nilai tukar dapat dilihat pada Lampiran. Setelah mendapatkan hasil dari *forecast variance* dan volatilitas untuk masing masing nilai tukar, selanjutnya dilakukan perhitungan VaR untuk masing masing nilai tukar. Asumsi *confidence level* 95% dan *holding period* 1 hari.

Hasil perhitungan VaR untuk nilai tukar USD dapat dilihat dari lampiran X. Kemudian hasil perhitungan VaR untuk masing masing nilai tukar dari tanggal 24 Desember 2007 – 31 Desember 2007:

Tabel 4.15

BAB V

KESIMPULAN

Bab ini akan menguraikan kesimpulan dan saran dari penelitian yang telah dilakukan sebagai berikut:

1. Dari hasil pengujian yang dilakukan diketahui bahwa data *return* untuk USD, EUR, JPY, GBP selama periode penelitian dari 12 Januari 2004 sampai dengan 31 Desember 2007 semua datanya memiliki data yang stasioner, memiliki distribusi tidak normal dan volatilitas bersifat heteroskedastic.
2. Berdasarkan estimasi volatilitas GARCH, dengan confidence level 95% maka potensi kerugian maksimum PT Bank X pada tanggal 31 Desember 2007 dengan eksposur valas USD Rp. 1,035,687,000,000.00 adalah sebesar 18,974,513.88, sementara eksposur valas EUR Rp. 166,824,000,000.00 adalah sebesar -337,904.30, untuk eksposur valas JPY Rp 707,000,000.00 adalah sebesar 2,413.10 dan yang terakhir GBP eksposur valas sebesar Rp. 19,804,000,000.00 adalah sebesar 155,087,56 semuanya dalam jutaan.
3. Berdasarkan estimasi volatilitas EWMA, dengan confidence level 95% maka potensi kerugian maksimum PT Bank X pada tanggal 31 Desember 2007 dengan eksposur valas USD Rp. 1,035,687,000,000.00 adalah sebesar 4.762,963,468.41, sementara eksposur valas EUR Rp. 166,824,000,000.00 adalah sebesar 1.534.514.853,85, untuk eksposur valas JPY Rp 707,000,000.00 adalah sebesar 8.304.327,41 dan yang terakhir GBP eksposur valas sebesar Rp. 19,804,000,000.00 adalah sebesar 175.871.207,28 semuanya dalam jutaan
