RANCANG CAMPUR BETON RINGAN DENGAN AGREGAT RINGAN PLASTIK BERDASARKAN METODE SNI 03-3449-2002

I. Data Perencanaan

- ◆ Kuat tekan beton ringan ($f'c_B$) = 172,40 kg/cm²
- ◆ Nilai tambah/margin (M) $M = k \times s$

dengan : M = nilai tambah
k = tetapan statistik (1,64)
s = deviasi standar (70 kg/cm²)
M = $1,64 \times 70 \text{ kg/cm}^2 = 114,80 \text{ kg/cm}^2$
- ◆ Kuat tekan beton ringan yang ditargetkan ($f'c_{Br}$)
$$\begin{aligned} f'c_{Br} &= f'c_B + M \\ &= 172,40 + 114,80 = 287,20 \text{ kg/cm}^2 \end{aligned}$$
- ◆ Berat Isi beton ringan yang disyaratkan (BI_{Br}) = 1850 kg/m³
- ◆ Semen yang digunakan OPC (type I / S-550)
- ◆ Agregat kasar ringan yang digunakan adalah agregat kasar dari limbah botol plastik (HDPE) dengan sifat – sifat yang didapat dari hasil pengujian laboratorium sebagai berikut :

Sifat – sifat	Agregat Plastik
Berat Jenis, ssd	0,954
Penyerapan Air, % berat	0,817
Kadar Lengas, % berat	0

- ◆ Agregat halus yang digunakan adalah agregat halus normal (Pasir Beton) dengan sifat – sifat dari hasil pengujian laboratorium sebagai berikut :

Sifat – sifat	Agregat Halus
Berat Jenis (Bulk Specific Gravity)	2,592
Penyerapan Air, % berat	0,503
Kadar Lengas, % berat	4,800

Perhitungan Rancang Campur

Kuat Tekan Adukan (Mortar) terhadap Kuat Tekan Hancur Agregat

- Berdasarkan pengujian terhadap agregat kasar ringan di laboratorium, di dapat kuat tekan hancur agregat ($f'c_A$) = 42,03 kg/cm².
- Kuat Tekan Beton Ringan yang ditargetkan ($f'c_{Br}$) = 287,20 kg/cm²
- Syarat Jumlah Fraksi Agregat Kasar Ringan, n_f : $0,35 \leq n_f \leq 0,50$

Maka Kuat Tekan Adukan ($f'c_M$) yang dibutuhkan :

Untuk $n_f = 0,35$

$$n_f = \frac{\log(f'c_{Br} / f'c_M)}{\log(f'c_A / f'c_M)}$$
$$0,35(\log 42,03 - \log f'c_M) = (\log 287,2 - \log f'c_M)$$
$$0,35(1,624 - \log f'c_M) = (2,458 - \log f'c_M)$$
$$0,65 \log f'c_M = 1,890$$
$$f'c_M = 808,52 \text{ kg/cm}^2$$

$f'c_M = 934,91 \text{ kg/cm}^2$, adalah batas minimum kuat tekan adukan yang masih dapat digunakan untuk mendapatkan kuat tekan beton yang ditargetkan pada rancang campur beton ringan dengan kuat tekan hancur agregat ($f'c_A$) = 42,03 kg/cm².

Untuk $n_f = 0,50$

$$n_f = \frac{\log(f'c_{Br} / f'c_M)}{\log(f'c_A / f'c_M)}$$
$$0,50(\log 42,03 - \log f'c_M) = (\log 287,2 - \log f'c_M)$$
$$0,50(1,624 - \log f'c_M) = (2,458 - \log f'c_M)$$
$$0,50 \log f'c_M = 1,646$$
$$f'c_M = 1958,84 \text{ kg/cm}^2$$

$f'c_M = 1958,84 \text{ kg/cm}^2$, adalah batas maksimum kuat tekan adukan yang dapat digunakan pada rancang campur beton ringan dengan kuat tekan hancur agregat ($f'c_A = 42,03 \text{ kg/cm}^2$).

- ◆ Maka kuat tekan adukan yang dibutuhkan untuk dapat mencapai kuat tekan beton yang ditargetkan adalah :
 $808,52 \text{ kg/cm}^2 = f'c_M = 1958,84 \text{ kg/cm}^2$
- ◆ Cek Kuat tekan adukan maksimum yang dibutuhkan pada grafik 7, apakah masih dapat memenuhi Kuat tekan maksimum yang tersedia.

Berdasarkan hasil perhitungan kuat tekan adukan yang dibutuhkan dengan kuat tekan hancur agregat, didapat kuat tekan adukan rencana berada diatas kuat tekan adukan maksimum grafik 7 SNI 03-3449-2002 yang memberikan batasan kuat tekan adukan maksimum ekonomis untuk campuran beton ringan struktural sebesar 535 kg/cm^2 . Maka digunakan kuat tekan adukan maksimum yaitu 535 kg/cm^2 dengan fraksi agregat kasar ringan (n_f) yang digunakan 0,5.

Menentukan Susunan Campuran Adukan (BI_M)

Berdasarkan grafik 7 diketahui dengan kuat tekan adukan maksimum ($f'c_M = 535 \text{ kg/cm}^2$), didapatkan susunan campuran adukannya, sebagai berikut :

◆ Semen	= 750	kg/m^3
◆ Air	= 162	kg/m^3
◆ Pasir	= 1500	kg/m^3 +
Jumlah = Bobot isi total adukan		= 2412 kg/m^3

Menentukan Susunan Campuran Beton (BI_{Br}) tiap m^3

◆ Semen	= $750 \times 0,5$	= 375	kg
◆ Air	= $162 \times 0,5$	= 81	kg
◆ Pasir	= $1500 \times 0,5$	= 750	kg
◆ Agregat Kasar	= $1000 \times 0,5 \times 0,954$	= 477	kg +
Jumlah = Bobot isi beton		= 1683	kg

Koreksi susunan campuran beton terhadap kandungan air dalam agregat
Dengan memperhitungkan jumlah air yang dapat di serap oleh agregat ringan kasar yang digunakan, yaitu
Penyerapan agregat ringan plastik = 0,817 %
Kadar air = 0 %

Hal ini berarti agregat tersebut masih dapat menyerap air sebanyak 0,817 %, maka :

- ♦ Jumlah air yang ditambahkan = $477 \times 0,00817 = 3,9$ kg
- ♦ Kebutuhan air pencampur seluruhnya menjadi = $81 + 3,9 = 84,9$ kg
- ♦ Agregat kasar ringan plastik dikurangi menjadi = $477 - 3,9 = 473,1$ kg

Susunan campuran beton ringan /m³ untuk uji coba setelah dikoreksi dan dibulatkan, menjadi

- ♦ Semen = 375 kg
- ♦ Air Pencampur = 85 kg
- ♦ Pasir = 750 kg
- ♦ Agregat ringan kasar = 473 kg

Koreksi terhadap agregat halus :

Kadar air = 4,8% ; penyerapan 0,503%

- Jumlah air yang dikurangi : $\left(\frac{4,8 - 0,503}{100} \right) \times 750 = 32,23$ Kg
- Kebutuhan air menjadi = $84,9 - 32,23 = 52,67$ Kg
- Agregat halus yang ditambahkan menjadi = $750 + 32,23 = 782,23$ Kg

Susunan campuran beton /m³ menjadi :

- Semen = 375 Kg
- Air = 52,67 Kg
- Pasir = 782,23 Kg
- Agregat = 473.10 Kg

**TEST FOR SPECIFIC GRAVITY
AND ABSORPTION-TEST OF COARSE AGGREGATE**

Sample : Agregat kasar ringan buatan
Source : Limbah botol plastik (HDPE)
Date Tested : November, 12th 2007

LABORATORIUM BAHAN
Departemen Sipil – Fakultas Teknik
Universitas Indonesia
Kampus Baru UI Depok
Telp. 7874878 – 7270029(Ext.18) – 7270028 (Fax)

Sampel Kubus Plastik Repsol (5x5x5) cm

Sampel Kubus Plastik Federal (5x5x5) cm

Sampel Kubus Plastik Castrol (5x5x5) cm

Kebutuhan Bahan Untuk Kubus Plastik Pertamina (15x15x15) cm

Proses Pembakaran Botol Pelumas Pertamina

Kebutuhan Bahan Untuk Kubus Plastik Federal (15x15x15) cm

Proses Pembakaran Bahan Plastik HDPE

Proses Pembakaran Botol Pelumas Castrol

Proses Pembakaran Botol Pelumas Repsol

LABORATORIUM BAHAN
Departemen Sipil – Fakultas Teknik
Universitas Indonesia
Kampus Baru UI Depok
Telp. 7874878 – 7270029(Ext.18) – 7270028 (Fax)

Contoh Botol, Potongan dan Kubus (5x5x5) Tipe Repsol

Contoh Botol, Potongan dan Kubus (5x5x5) Tipe Castrol

Proses Pembersihan, Pemotongan dan Pemilihan Bahan HDPE

Alat-Alat Yang Digunakan

Proses Pengayakan Pasir Bergradasi

Tes Kubus Plastik Ukuran (5x5x5) cm

Pola Retak Kubus Plastik (5x5x5) cm

Penimbangan Kubus Plastik (15x15x15) cm Dalam Air Untuk Tes SG

Sampel Kubus Plastik (15x15x15) cm

Pengetesan Kuat Tekan Kubus Plastik (15x15x15) cm

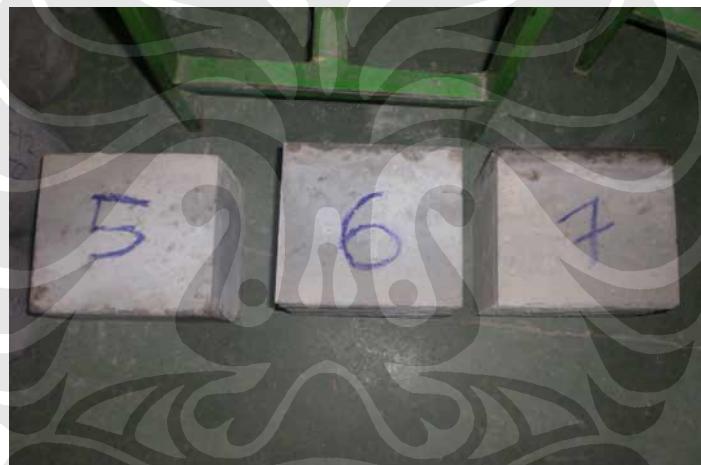

Pola Retak Kubus Plastik (15x15x15) cm

Tes Slump Beton Ringan Degan Agregat Kasar Ringan Plastik

Sampel Kubus dan Silinder Beton Ringan Dalam Cetakan

Sampel Kubus (15x15x15) cm Beton Ringan

Sampel Kubus (5x5x5) cm Beton Ringan

LABORATORIUM BAHAN
Departemen Sipil – Fakultas Teknik
Universitas Indonesia
Kampus Baru UI Depok
Telp. 7874878 – 7270029(Ext.18) – 7270028 (Fax)

Pengetesan Kubus (15x15x15) cm Beton Ringan

Pengetesan dan Pola Retak Kubus (5x5x5) cm Beton Ringan

Pola Hancur Kubus (5x5x5) cm Beton Ringan

Pengetesan dan Pola Retak Silinder Beton Ringan

Pola Hancur Kubus (15x15x15) cm Beton Ringan

Pola Hancur Retak (15x15x15) cm Beton Ringan

**Contoh Agregat Yang Telah Kering
Dalam Wajan**

Contoh Botol, Potongan dan Kubus (5x5x5) Tipe Shell

Pengetesan Modulus Elastisitas dan Poisson Rasio
