This is a user-friendly guide to the principles of complete denture construction. It is a practical, extensively illustrated book for the general dental practitioner, starting with the examination of the edentulous patient and progressing through the different treatments in a logical way. A range of procedures has been described in sufficient detail so that the dentist can apply the best treatment measure to the specific clinical problem. A final chapter on domiciliary treatment has been included because elderly, housebound patients often present problems such as denture retention (because of the patient's residual ridge atrophy or insufficient muscular control). Reference to original research work has been included so that the reader can explore the research evidence for himself.
